Page

1. WELCOME

2. APOLOGIES

No apologies received at time of publication.

3. PUBLIC FORUM

At the time of publishing no requests to speak had been received.

4. CONFIRMATION OF AGENDA

Note: Any additions must be approved by resolution with an explanation as to why they cannot be delayed until a future meeting.

5. DECLARATION OF INTERESTS

Members are reminded of the need to stand aside from decision-making when a conflict arises between their role as an elected representative and any private or other external interest they might have. [The Register of Councillors Pecuniary Interests](#) are published on the ORC website.

6. PRESENTATIONS

At the time of printing no requests to present had been received.

7. CONFIRMATION OF MINUTES

3

That the minutes of the Environmental Science and Policy Meeting of 27 June 2024 be received and confirmed as a true and accurate record.

10. CLOSURE

Environmental Science and Policy Committee MINUTES

Minutes of an ordinary meeting of the Environmental Policy and Science Committee held in the Council Chamber, Level 2 Philip Laing House, 144 Rattray Street, Dunedin on Thursday 27 June 2024, commencing at 11:15 AM.

PRESENT

Cr Lloyd McCall *(Chairperson)*
Cr Alexa Forbes
Cr Gary Kelliher
Cr Michael Laws *(online)*
Cr Kevin Malcolm
Cr Tim Mephram
Cr Andrew Noone
Cr Gretchen Robertson
Cr Bryan Scott
Cr Alan Somerville
Cr Elliot Weir
Cr Kate Wilson

1. WELCOME

Chair McCall welcomed Councillors, members of the public and staff to the meeting at 11:15am. Staff present included Richard Saunders (Chief Executive), Anita Dawe (GM Policy and Science), Joanna Gilroy (Acting GM Regulatory), Amanda Vercoe (GM Governance, Culture and Customer), Kylie Darragh (Governance Support), and Tom Dyer (Manager, Science) Sarah Harrison (Scientist - Air Quality), Jason Augspurger (Senior Scientist Freshwater Ecology), Scott Jarvie (Scientist, Biodiversity), Ben Mackey (Team Leader – Land) Mark Crawford (Scientist - Land and Soil) Helen Trotter (Water Quality Scientist).

2. APOLOGIES

Apologies for Edward Ellison and Karen Coutts were noted. Also noted were apologies for Cr Mephram and Cr Forbes for early departures.

3. PUBLIC FORUM

There were no requests to speak at this meeting.

4. CONFIRMATION OF AGENDA

Recommendation moved Cr Wilson, Cr McCall seconded that:

The agenda be confirmed as published.

5. DECLARATIONS OF INTERESTS

The Chair reminded Councillors of the need to stand aside if a conflict of interest arises. No changes to Councillor Declarations of Interests were noted.

6. PRESENTATIONS

No presentations were held.

7. CONFIRMATION OF MINUTES

Resolution ESP24-104: Cr McCall Moved, Cr Somerville Seconded

That the minutes of the Environmental Science and Policy Committee meeting held on 20 March 2024 be confirmed as a true and accurate record including a correction.

MOTION CARRIED

8. OPEN ACTIONS FROM RESOLUTIONS OF THE COMMITTEE

There are currently no open actions for this committee.

9. MATTERS FOR CONSIDERATION

9.1. SOE Air Quality Trends

(YouTube:00:10:55) This report was brought to the committee to share the State of the Environment (SOE) report: Air quality trends 2005 – 2023 and to briefly summarise the SOE reports' key findings. Sarah Harrison (Scientist, Air Quality) Tom Dyer (Manager, Science) and Anita Dawe (GM Policy and Science) were available to respond to questions.

Resolution ESP24-106: Cr Wilson Moved, Cr Forbes Seconded

That the Environmental Science & Policy Committee:

- 1) Notes this report.**

MOTION CARRIED

9.2. Annual Water Quality Report 2023

(YouTube 00:35:22) The purpose of this report was to present the Water Quality and Biomonitoring report 2018-2023 to the Committee. The report presented the most recent results of State of the Environment (SoE) monitoring undertaken to inform attribute tables in Appendix 2A and Appendix 2B of the National Policy Statement for Freshwater Management (NPSFM, 2020).. Jason Augspurger (Senior Scientist Freshwater Ecology), Anita Dawe (GM Policy and Science), Tom Dyer (Manager, Science) were available to respond to questions on the report which was noted to still be in draft with some proofing required.

Resolution ESP24-107: Cr Robertson Moved, Cr Wilson Seconded

That the Environmental Science & Policy Committee:

- 1) Notes this report.**

MOTION CARRIED

At 12:30pm the committee adjourned for lunch and reconvened at 1:05pm.

Cr Mepham left the meeting at 12:30pm.

Cr Laws left the meeting at 1:35pm.

9.3. Regional conservation statuses in Otago

(YouTube 02:20:00) This paper set out work currently underway in the biodiversity area at ORC to document indigenous biodiversity. It overviewed the development of regional threat classifications and included details of regional conservation statuses for the species groups of indigenous vascular plants and amphibians in Otago. Scott Jarvie (Scientist, Biodiversity), Tom Dyer (Manager, Science) and Anita Dawe (GM Policy and Science) were available to respond to questions.

Resolution ESP24-108: Cr Weir Moved, Cr Wilson Seconded

That the Environmental Science & Policy Committee:

- 1) Notes this report.**
- 2) Notes that the regional threat assessment for other species (taxonomic) groups will continue as part of the biodiversity work programme.**

MOTION CARRIED

Cr Forbes left the meeting at 1:51pm.

9.4. Land & Soil Monitoring Update

(YouTube 02:38:46) This report provided an annual update on the Land and Soil work programme. Ben Mackey (Team Leader – Land) Mark Crawford (Scientist - Land and Soil) Anita Dawe (GM Policy and Science) and Tom Dyer (Manager, Science) were available to respond to questions.

Resolution ESP24-109: Cr Robertson Moved, Cr Malcolm Seconded

That the Environmental Science & Policy Committee:

- 1) *Notes this report.*

MOTION CARRIED

9.5. Contact Recreation 2024 Annual Report Card

(YouTube 03:07:40) The contact recreation programme monitors faecal indicator bacteria and potentially toxic cyanobacteria at 20 freshwater and 16 coastal sites across the Otago Region to assess risks to human health during the summer bathing period. This report provided an overview of the programme and included a report card summarising the results of weekly monitoring undertaken during the 2023-24 season. Helen Trotter (Water Quality Scientist) Anita Dawe (GM Policy and Science) and Tom Dyer (Manager, Science) were available to respond to questions on the report.

Resolution ESP24-110: Cr Weir Moved, Cr Wilson Seconded

That the Environmental Science & Policy Committee:

- 1) *Notes this report.*

MOTION CARRIED

10. CLOSURE

There was no further business and Chair McCall declared the meeting closed at 2:33pm.

Chairperson _____ Date _____

9.1. Regional conservation status of birds in Otago

Prepared for: Environmental Science and Policy Committee
Report No. GOV2424
Activity: Governance Report
Author: Scott Jarvie, Scientist - Biodiversity
Endorsed by: Tom Dyer, General Manager Science and Resilience
Date: 26 September 2024

PURPOSE

[1] This paper documents the regional conservation status of birds in the Otago Region.

EXECUTIVE SUMMARY

- [2] This paper outlines regional conservation statuses and their role in monitoring biodiversity and biosecurity.
- [3] The first report on the regional conservation status of birds in Otago is presented.
- [4] A total of 283 bird species were assessed. Of these birds 32 were Regionally Threatened, four were Regionally At Risk, 135 were Regionally Non-resident Native, 22 were Regionally Not Threatened, 25 were Regionally Introduced and Naturalised, and 10 were Regionally Data Deficient. Three species were translocated to the region for conservation benefit; two of these were reintroductions while one was an introduction. Ten species were also Regionally Introduced, Not Established (i.e., where a release is documented but with no self-sustaining population) and two were Regionally Not Assessed (i.e., have been assessed in previous national assessments but are currently not assessed). The number of regionally extinct bird species is 43.
- [5] The information in threat assessments for birds can inform biodiversity and biosecurity management in Otago.

RECOMMENDATION

That the Council:

- 1) **Notes** this report.
- 2) **Notes** that regional threat assessment for other species groups will continue as part of the terrestrial ecology work programme.

BACKGROUND

- [6] Regional councils have statutory obligations to protect and maintain indigenous biodiversity under the Resource Management Act 1991 (RMA).
- [7] Threat classifications play a key role in biosecurity and biosecurity management. The New Zealand Threat Classification System (NZTCS) is a national system to assess the conservation status of species found in the wild in Aotearoa New Zealand. The system is administered by the Department of Conservation Te Papa Atawhai (DOC) on behalf of all New Zealanders and complements the International Union for Conservation of Nature (IUCN) Red List system.

- [8] The NZTCS and IUCN use rules-based approach to assess the risk of extinction based on estimates of population size and trend. These national and international assessments are used to inform conservation action, target resources, and monitor biodiversity trends and conservation effectiveness.
- [9] Regional council ecologists from Te Uru Kahika (Regional and Unitary Councils Aotearoa) are working with DOC to develop a standardised methodology for regional threat assessments¹. The methodology uses a similar rule-based approach to the NZTCS but takes the size of each region into account for the assessments. Regional threat assessments complement both the NZTCS and the IUCN Red List system.
- [10] Qualifiers in threat assessments provide additional information about species. They can help in understanding the basis for assessments and can provide useful information to support management decisions.
- [11] Regional threat assessments help local authorities manage and protect biodiversity within their regions. For example, knowledge of threatened species present at a site is of particular importance for consenting processes and systematic conservation planning.
- [12] Regional conservation statuses can also guide decisions on where local authorities fund biosecurity and/or biodiversity management. Information regarding the species present, as well as their threat status, can aid decision-making processes. For example, identification of priority sites and guidance on management actions should happen to ensure appropriate activities are part of restoration programmes.
- [13] The ORC has completed regional conservation status assessments for amphibians, bats, indigenous vascular plants, and reptiles².

DISCUSSION

- [14] The fifth in a series of regional conservation status reports has recently been completed this time focusing on birds in Otago.
- [15] For bird species, an expert panel and an ecologist from the ORC assessed 283 species in, or near, Otago.
- [16] The number of Regionally Threatened bird species was 32 (Critical = 9, Regionally Endangered = 6, Regionally Threatened = 17), 4 as Regionally At Risk (Regionally Declining = 3; Regionally Recovering = 1), 135 as Regionally Non-resident Native (Regional Migrant = 36; Regional Vagrant = 97; Regional Coloniser = 2), 22 as Regionally Not Threatened, 10 as Regionally Data Deficient, and 25 as Introduced and Naturalised. Three species were translocated to the region for their conservation benefit: two were reintroductions while one was an assisted migration. Ten species are Introduced, Not Established, and two were Not Assessed. An additional 43 species are regionally extinct.

¹ A manual to document the methodology will be published as a national guideline. Dr Jarvie will be a co-author of the manual.

² Amphibians and indigenous vascular plants: <https://www.orc.govt.nz/media/beugmwjc/20240627-esp-agenda.pdf>; bats: <https://www.orc.govt.nz/media/15330/2023-10-11-esp-agenda.pdf>; reptiles: <https://www.orc.govt.nz/media/14694/minutes-environmental-science-and-policy-20230426.pdf>.

- [17] Otago is a national stronghold for eight bird species, meaning more than 20 percent of the national population for each species is in the region. Of these bird species, only one species was a regional endemic, the Otago shag/matapo, meaning they breed nowhere else.
- [18] Two bird species breed in one location in the region: the northern royal albatross/toroa, which was first recorded breeding at Taiaroa Head/Pukekura in 1938 and number 242 mature individuals as of 2023, and Haast tokoeka, which were released at Orokonui Ecosanctuary – Te Korowai o Mihiwaka, near Dunedin, with ~35 mature individuals.
- [19] Of resident native bird species 25 are adversely affected, or predicted to be adversely affected, by long-term climate trends and/or extreme climatic events. All the bird species with the climate impact qualifier are in the Regionally Threatened or Regionally At Risk categories, except for two species. The main habitat types for these birds are coastal or marine, followed by wetland or riverine, and finally forest, grassland or shrubland.
- [20] For the 17 native bird species likely to move to a worse conservation status if current management ceases, such as if ongoing invasive mammal predator control by DOC or community groups stopped, all of them were either Regionally Threatened or had been translocated to the region for their conservation benefit. Six of these species were Regionally Critical – the most severely threatened status. Most of these were because they had a population size less than 250 mature individuals, except for the southern rock wren/pīwauwau and yellow-eyed penguin/hoiho with a population of 250–1000 mature individuals but population trends decreasing by 50–70 % and trend decreasing by 70 %, respectively. The southern rock wren/pīwauwau trend was based over 10.5 years (3 generations) while the yellow-eyed penguin/hoiho over 15 years.
- [21] When a new species is described, the name is permanently linked to a single ‘type collection’. Any interpretation or re-interpretation of the species is therefore dependent on type collections. In turn the type locality, and any population of the organism present at the type locality, becomes an important asset. The number of species in Otago with type localities was 13. There were four living species with type localities: Australasian crested grebe/pūteketeke, fairy prion/tītī wainui, Fiordland crested penguin/tawaki, and Otago shag/matapo. Nine extinct species have their type locality in the region, such as the South Island laugh owl/whēkau, South Island adzebill/ngutu hahau, and South Island giant moa/moa nunui.
- [22] A total of 98 native bird species were recorded in Otago’s Territorial Authorities, excluding those species that are Regionally Vagrants and Extinct; this also means introduced bird species are not included. The territorial authority with the most species is Dunedin City Council (62), followed by Clutha District Council (56), then Waitaki District Council (54; Otago part only), Queenstown Lakes District Council (51), and Central Otago District Council (39).
- [23] The number of living native bird species recorded in Otago’s Coastal Marine area was 68, excluding Regional Vagrants, highlighting the importance of Otago’s coastal and marine space to indigenous biodiversity. All Regional Migrants were recorded in or near the Coastal Marine area; they were all seabirds except for the white heron/kōtuku.

OPTIONS

[24] This report is for noting and therefore does not present options.

CONSIDERATIONS

Strategic Framework and Policy Considerations

[25] The biodiversity programme contributes towards the *Healthy water, soil and coast*, and *Healthy diverse ecosystems* strategic priorities. The work outlined in this paper aligns with visions in ORC's Biodiversity Strategy Plan 2018: Our Living Treasure | Tō tatou Koiora Taoka and with visions and outcomes in the Biodiversity Action Plan Te Mahi hei Tiaki i te Koiora 2019 –2024.

Financial Considerations

[26] The process to run regional threat assessments are budgeted and are a planned activity.

Significance and Engagement

[27] Engagement is ongoing with mana whenua, government agencies, stakeholders, and landowners who work in biodiversity management, as well as on a project-by-project basis to undertake subsequent surveys and monitoring.

Legislative and Risk Considerations

[28] ORC has legislative responsibilities to protect significant habitats of indigenous fauna as a matter of national importance, as well as to maintain indigenous biodiversity. These threat assessments enable the ORC to be understand the status and trends of species and ecosystems in the region.

Climate Change Considerations

[29] The report assessed whether the birds are vulnerable to climate change.

Communications Considerations

[30] The regional conservation statuses have a dedicated ORC webpage where the report and accompanying spreadsheets are provided. The reports are also provided to members of the Otago Biodiversity Forum, whose memberships include mana whenua, territorial authorities, and other agencies. Accompanying the publication of most reports is a media release.

[31] Using information from the regional conservation status ORC works with taxonomic experts and Tūhura Otago Museum to develop educational resources. This includes the development of guides and/or posters to make information more accessible to members of the public and can be used in community science initiatives.

NEXT STEPS

[32] Regional threat assessments for other groups will continue as part of the biodiversity work programme.

[33] Assessments have started for selected species of fungi and Onchyophora (peripatus, or velvet worms)

[34] Work is underway to compile lists for other species groups, including freshwater fish, marine mammals, mosses, liverworts and hornworts, and lichens. The compilation of such works is a precursor to conducting a regional conservation status for a species group. Mana whenua have been consulted and are particularly interested to have

completed assessments for the freshwater fish and mammal mammals, in addition to those already done for reptiles, bats, birds, and indigenous vascular plants.

- [35] Publication of the manual for the regional conservation status methodology. The manual is ongoing peer review and will be released by DOC.

Regional conservation status of birds in Otago

Otago Threat Classification Series is a scientific monograph series presenting publications related to regional threats assessments of groups of taxa in the Otago Region. Most will be lists providing regional threat assessments of members of a plant or animal group (e.g., amphibians, bats, birds, indigenous vascular plants, reptiles), and leverages off national assessments for the New Zealand Threat Classification System within the regional context.

Regional conservation status of birds in Otago

Executive Summary

This report provides the first assessment of the regional conservation status of bird taxa known to occur in Otago since human arrival in Aotearoa New Zealand. Standardised methodology was followed to assess the regional threat status of 283 bird taxa. Thirty-two were assessed as Regionally Threatened (Regionally Critical = 9; Regionally Endangered = 6; Regionally Vulnerable = 17), four as Regionally At Risk (Regionally Declining = 3; Regionally Recovering = 1), 135 as Regionally Non-resident Native (Regional Migrant = 36; Regional Vagrant = 97; Regional Coloniser = 2), 22 as Regionally Not Threatened, 10 as Regionally Data Deficient, and 25 taxa as Introduced and Naturalised. Three taxa were identified as Conservation Translocations where they have been deliberately moved to the region for conservation benefit and have extant populations: two of these were Reintroductions and one was an Assisted Migration. The number of Regionally Extirpated taxa was 43, i.e., 30 are Globally Extinct and 13 are Regionally Extinct (two of these have been Reintroduced and have extant populations). Ten taxa are Introduced, Not Established, i.e., where a release is documented, but with no self-sustaining population in the wild; or a deliberate introduction is documented, and published records indicate the species bred (or probably bred), but it is no longer extant; and two are Not Assessed, i.e., have been assessed in earlier national assessments but currently not assessed.

Regional conservation status of birds in Otago

Introduction

Threat classifications play an important role in monitoring biodiversity and informing conservation actions. The New Zealand Threat Classification System (NZTCS) is a tool used to assign a threat status to candidate taxa (species, subspecies, varieties, and forma) in Aotearoa New Zealand (Townsend et al. 2008). The classification system was developed to apply equally to terrestrial, freshwater, and marine biota (flora and fauna). The NZTCS scores taxa at the national scale against criteria based on an understanding of population state, size, and trend, while considering population status, impact of threats, recovery potential, and taxonomic certainty. The Department of Conservation – Te Papa Atawhai (DOC) administers the NZTCS in Aotearoa New Zealand, with national assessments used to inform conservation action, target resources, and monitor biodiversity trends and conservation effectiveness.

While DOC is tasked with managing indigenous taxa nationally, regional and district councils have statutory obligations to maintain indigenous biodiversity under the Resource Management Act 1991 (RMA), including to manage the habitats of threatened taxa. The regional threat status of taxa is particularly important in the context of the RMA and in conservation planning. A key requirement of managing the habitats of threatened taxa is to understand distributions and regional population sizes, and to monitor trends and management intervention effectiveness.

This report is the first regional conservation status assessment for bird species in the Otago Region. Regional threat assessments have been completed following a standardised methodology by Otago Regional Council for four taxonomic groups (bats, Jarvie et al. 2023a; indigenous vascular plants, Jarvie et al. 2024a; reptiles, Jarvie et al. 2023b, Jarvie et al. 2024b; amphibians, Jarvie 2024), Greater Wellington Regional Council for five taxonomic groups (bats, Crisp et al. 2023a; birds, Crisp et al. 2024; indigenous freshwater fish, Crisp et al. 2022; indigenous vascular plants, Crisp 2020; reptiles, Crisp et al. 2023b) and Auckland Council for five taxonomic groups (amphibians, Melzer et al. 2022a; reptiles, Melzer et al. 2022b; indigenous vascular plants, Simpkins et al. 2023; bats, Woolly et al. 2023; freshwater fish, Bloxham et al. 2024) as of August 2024. Regional threat assessments also provide a stronger foundation for assessing the threat status of taxa nationally. The methodology for the regional threat assessments leverages off national threat assessments as determined using the NZTCS (Townsend et al. 2008, Rolfe et al. 2021, Michel 2021), with thresholds for area of occupancy or population size adjusted for the land area in the region (Appendix 1). National strongholds and additional regional qualifiers were also considered (Appendix 2).

Regional conservation status of birds in Otago

Methods

The regional threat status of birds was assessed by a panel of experts (Bruce McKinlay, Dawn Palmer, Nicolas J. Rawlence, and Oscar Thomas) and an Otago Regional Council (ORC) ecologist (Scott Jarvie) in June 2023 and reviewed in June 2024. This assessment covers bird taxa present in the region, following standardised methodology for regional threat assessments as shown in Appendix 1, the list of regional qualifiers in Appendix 2, and the list of national qualifiers in Appendix 3. The national threat assessments and national qualifiers were from Robertson et al. (2021). Following Robertson et al. (2021), all taxa were classified as: 1) 'taxonomically determinate', i.e., legitimately and effectively published and generally accepted by relevant experts as distinct; or 2) 'taxonomically unresolved', i.e., used loosely to include both undescribed entities which still require formal taxonomic research to confirm their validity and provide them with a formal name and, occasionally, described species whose taxonomic validity is in question. Although the taxonomic nomenclature from Robertson et al. (2021) were used to follow the methodology, scientific names from the Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided in notes in the Tables and in Appendix 4.

Following the standardised methodology, bird taxa not observed in the region were first removed from consideration based on those recognised in the NZTCS list (Robertson et al. 2021) and recent publications (e.g., Rawlence et al. 2017; see Appendix 4 for information on how these publications have changed the names used). The next step was to identify Nationally Threatened and At-Risk taxa that breed or are resident in the region. If more than 20% of the national population is breeding or resident for more than half their life cycle in the region, taxa were assigned the National Stronghold qualifier and the NZTCS criteria applied. The regional conservation status must not be a lower threat status than the national status. For example, a Nationally Endangered taxon cannot be assessed as Regionally Vulnerable or lower but could be assessed as Regionally Critical.

Regional thresholds were set at more than 2000 mature individuals present or occupancy of more than 1000 ha. If taxa did not meet the threshold, they were assigned a regional threat status by applying the NZTCS criteria. If taxa did meet the threshold and the population trend was $\pm 10\%$ stable or increasing, they were assigned the status Regionally Not Threatened.

For Nationally Not Threatened and Non-Resident taxa, the regional population threshold was applied. If the population was not stable to increasing/decreasing by

Regional conservation status of birds in Otago

more than 10%, the NZTCS criteria were used to determine the regional threat status. Population trend criteria were applied based on current knowledge, projecting from recent past into the future over the next 10 years or three generations, whichever is the longer. Regionally Non-Resident Natives are bird taxa whose natural presence is discontinuous as they are classified as a Regional Migrant, sporadic or temporary as a Regional Vagrant, or which have succeeded in recently (since 1950) establishing a resident breeding population as a Regional Coloniser.

Bird taxa that have become established in Otago after deliberate or accidental introduction by humans are classified as Introduced and Naturalised. To be considered naturalised, taxa must have established a self-sustaining population in the wild over at least three generations and must have spread beyond the site of initial introduction. Similar to [New Zealand Birds Online](#), a category for Introduced, Not Established was included. This category includes bird species sighted in Otago where a: 1) release is documented, but with no self-sustaining population in the wild; or 2) a deliberate introduction is documented, and published records indicate the species bred (or probably bred), but it is no longer extant. A Not Assessed category was also included, like the national assessment.

In the Tables with the regional threat assessment information a notes column provides additional information that may be of interest to readers, e.g., locations of type localities, names and authority, and common names from the Checklist of the Birds of New Zealand (Checklist Committee, 2022), if the taxon is listed as a specified highly mobile fauna in the National Policy Statement for Indigenous Biodiversity (NPS-IB; Ministry for the Environment – Manatū Mō Te Taiao, 2023; Appendix 5), and the International Union for Conservation of Nature (IUCN) Red List of Threatened Species status for indigenous taxa (2024–1; downloaded, July 29, 2024; Appendix 6).

The IUCN information is provided as the New Zealand Coastal Policy Statement (Department of Conservation – Te Papa Atawhai, 2010) and its accompanying Document for Policy 11(a) (Indigenous Biological Diversity – Biodiversity; Department of Conservation – Te Papa Atawhai, 2019) provide guidance for taxa that are listed by the International Union for Conservation of Nature and Natural Resources (IUCN) as Threatened. The IUCN is an international system for evaluating the conservation status of plant, animal, and fungi species in the global context. 'Threatened' taxa are grouped into one of three categories: 'Critically Endangered', 'Endangered', and 'Vulnerable'. The different contextual scales of the IUCN Red List and the NZTCS means that a taxon may rank differently under the two systems. The NZTCS lists more taxa than the IUCN Red List simply because effort has been made to include as many species as possible.

Regional conservation status of birds in Otago

Information is also provided on where extant bird taxa in the Regionally Threatened, At Risk, Migrant, and Introduced and Naturalised categories have recently been recorded in Otago. This included records for each territorial authority, the Coastal Marine Area (which extends from mean high-water springs out to the 12 nautical mile (22.2 kilometre) limit of the territorial sea, from the Waitaki River in the north to Wallace Beach in the south), and for each Freshwater Management Unit (FMU), of which the Clutha Mata-au FMU is subdivided into five rohe (areas). To further indicate bird taxa presence by territorial authority, Coastal Marine Area or FMU, the status was divided into breeding, suspected breeding, confirmed presence, and suspected presence. Bird taxa that are nationally extinct or regionally extirpated in the Otago region were also identified.

To inform decisions on population numbers and distributions for the regional threat status of bird taxa, occurrence records were used from data repositories, including eBird (Sullivan et al. 2009), and taxonomically harmonised with the listed bird taxa in the NZTCS (Robertson et al. 2021). The records were viewed in a locally operated dashboard using R v. 4.2.2 (R Core Team 2022) via the RStudio platform (Posit Team 2023). The main packages used were 'shiny' (Chang et al. 2021) and 'flexdashboard' (Iannone et al. 2020). The map layers used to view records were OpenStreetMap and Esri WorldImagery. The expert panel was further informed by published and unpublished reports, data base summaries (e.g., eBird, Sullivan et al. 2009; New Zealand Birds Online), the Checklist of the Birds of New Zealand (Checklist Committee, 2022), IUCN Red List of Threatened Species (2024), and local, regional, and national personal communications. The panel critically assessed the available data and drew on their own expert knowledge to consider current and likely future threats to determine the status and qualifiers for each species.

Regional conservation status of birds in Otago

Results

A total of 283 bird taxa were identified as being in the Otago Region since human arrival in Aotearoa New Zealand (Figure 1). Of these taxa, 32 are Regionally Threatened, four are Regionally At Risk, 135 are Regionally Non-resident Native, 22 are Regionally Not Threatened, 10 are Regionally Data Deficient, and 25 taxa are Introduced and Naturalised. Additionally, 43 taxa are identified as Regionally Extirpated, 10 taxa are Introduced, Not Established, and two are Not Assessed. Translocations to reintroduce or introduce species to the region have happened for conservation purposes; three of them are currently in progress, with two of these conservation translocations being reintroductions and one of them being an assisted migration.

For 32 Regionally Threatened taxa in Otago, nine are Regionally Critical, six are Regionally Endangered, and 17 are Regionally Vulnerable. Of the four Regionally At Risk taxa, three are Regionally Declining and one is Regionally Recovering. For Regionally Non-resident Native species, 36 are identified as Regional Migrants, 97 are Regional Vagrants, and two as Regional Colonisers. In Otago 43 are Regionally Extirpated; 30 species are globally extinct and 13 species are extant in Aotearoa New Zealand but extinct from Otago.

The region was identified as a national stronghold for eight bird taxa. These species have > 20% of the national population in Otago. Of those taxa with National Strongholds, only one taxon is a Regional Endemic, the Otago shag / matapo, *Leucocarbo chalconotus*, meaning they are not found elsewhere, i.e., known to exclusively breed in the region. One taxon was at their natural southern range limit for breeding within the region, wrybill / ngutu pare, *Anarhynchus frontalis*, excluding the regional endemic taxon. The number of taxa with type localities in the Otago region was 13; four are for extant taxa while nine are for extinct taxa (Appendix 8).

Numerous bird taxa are present in every Territorial Authorities, Coastal Marine Area, and Freshwater Management Unit or rohe in the Otago Region. For the categories of Regionally Threatened, Regionally At Risk, Regionally Non-resident (Migrant and Coloniser only), Regionally Introduced and Naturalised, and Regionally Conservation Translocated bird these are listed in Tables 2 and 3. In these tables 123 bird taxa were recorded as present in Territorial Authorities or the Coastal Marine Area, with 98 on them being native (Table 2). The number of bird taxa in territorial authorities ranged from 86 in Dunedin City Council to 63 in Central Otago District Council. The Region had 70 bird taxa (68 native, 2 Introduced and Naturalised) recorded from its Coastal Marine area. Of the above categories the number of bird taxa recorded in Otago

Regional conservation status of birds in Otago

Regional Council's Freshwater Management Units (FMU) or rohe was 95, with 68 of these being native (Table 3). The highest number of bird taxa in a FMU or rohe is the Dunedin and Coast FMU with 83, with the least number in both the Manuherekia Rohe and Roxburgh Rohe with 56.

Regional conservation status of birds in Otago

Regionally Extirpated (43)

Taxa for which there is no reasonable doubt that the species is no longer present in the wild in Otago. The list includes nationally extinct and regionally extirpated bird taxa.

Table 1.1: Regionally Extirpated bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Qualifiers	National Qualifiers	Notes
REGIONALLY EXTIRPATED (43)						
REGIONALLY EXTINGUISHED (13)						
<i>Taxonomically determinate (11)</i>						
<i>Apteryx owenii</i> Gould, 1847	little spotted kiwi	kiwi pukupuku	Nationally Increasing		CI, CD, Inc, RR	IUCN: Threat Status: Near Threatened Formerly widespread on both main islands, but now confined to translocated populations on offshore islands and one mainland sanctuary. Common in Nelson / Whakatū, Westland, and Te Rua-o-Te-Moko / Fiordland to the early 1900s, but gradually disappeared leaving a small population on D'Urville Island / Rangitoto ki te Tonga. It is believed five individuals were introduced to Kapiti Island / Ko te Waewae Kapiti o Tara Raua ko Rangitane from the Jackson Bay / Okahu area in 1912, where they flourished. Although transfers to other pest-free sites have seen numbers increase, low genetic diversity exists in the species.
<i>Callaeas cinerea</i> (Gmelin, 1788)	South Island kokako	kōkā*	Data Deficient		PE	IUCN: Threat Status: Critically Endangered Very high likelihood of at least being functionally extinct. The last record accepted by the Records Appraisal Committee of Birds New Zealand for South Island kokako / kōkā was in 2007, with this not being in Otago (Upper Inangahua Valley; Miskelly et al. 2013).
<i>Cyanoramphus malherbi</i> Souancé, 1857	orange-fronted parakeet	kākāriki karaka	Nationally Critical		CI, CD, CR, EF, RR	IUCN: Common Name and Threat Status: Malherbe's parakeet. Critically Endangered. Formerly widespread in Aotearoa New Zealand but now restricted to forested valleys in Waitaha / Canterbury and translocated populations. The Otago naturalist Alfred Philpott observed, in 1919, that while the orange-fronted parakeet / kākāriki karaka was not as abundant as the other species of indigenous parakeet, it is "in all probability extinct".
<i>Gallirallus australis hectori</i> (Hutton, 1873)	buff weka	weka	Relict			IUCN: Name and Authority, Common Name and Threat Status: <i>Gallirallus australis</i> Sparrman, 1786; Weka; Vulnerable. Formerly widespread on Te Waipounamu / South Island along eastern low-rainfall areas from Marlborough / Te Taihū-o-te-Waka to Southland / Murihiku. Apparently died out on the mainland but remains abundant on Chatham Islands / Rēkohu / Wharekauri and Pitt Island / Rangihau / Rangitūria where introduced in 1905. Reintroduced to five islands in two lakes (Lake Wānaka and Lake Wakatipu / Whakatipu Waimāori) and a mainland site (Motatapu Valley) Otago (Miskelly & Powlesland 2013). Reintroduced populations are still present on the islands and individuals were in the Motatapu Valley in 2021. Although a recent study inferred only one subspecies of weka for each of the main islands in Aotearoa New Zealand (Trewick et al. 2017), the NZTCS taxonomy is followed in regional conservation status assessments so multiple lineages in Te Waipounamu / South Island were assessed in this report.

Regional conservation status of birds in Otago

Regionally Extirpated continued

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Qualifiers	National Qualifiers	Notes
<i>Gallirallus philippensis assimilis</i> (G.R.Gray, 1843)	banded rail	moho pererū	Declining		CI, CR, DPS, DPT, RR	IUCN: Name and Authority, Common Name and Threat Status: <i>Hypotaenidia philippensis</i> (Linnaeus, 1766); Buff-banded rail; Least Concern. NPS-IB: listed Specified Highly Mobile Fauna Formerly common throughout the main islands of Aotearoa New Zealand. On Te Ika-a-Māui / North Island found in Northland (including Manawatāwhi / Three Kings, Poor Knights, Hauturu / Little Barrier, and Great Barrier / Aotea Islands), Tāmaki Makaurau / Auckland, Waikato, Coromandel / Kapanga, and Bay of Plenty / Te Moana-a-Toi but rare south of 39°S (Marchant & Higgins 1993). In Te Waipounamu / South Island found in coastal north-west Nelson / Whakatū, Golden Bay / Mohua and Pelorus Sound, and rare elsewhere (Elliott 1989). Islands south-west of Rakiura / Stewart Island.
<i>Pelecanoides whenuahouensis</i> Fischer et al., 2018	Whenua Hou diving petrel	kuaka Whenua Hou*	Nationally Critical		CI, CD, CR, IE, OL	Checklist Committee: Name and Authority: <i>Pelecanoides georgicus whenuahouensis</i> Fischer, Debski, Miskelly, Bost, Fromant, Tennyson, Tessier, Cole, Hiscock, Taylor & Wittmer 2018 IUCN: Name and Authority, Common Name and Threat Status: <i>Pelecanoides georgicus whenuahouensis</i> Fischer et al., 2018; Critically Endangered. Bones found in a midden at Sandfly Bay, Otago Peninsula / Muaūpoko were morphologically identified as South Georgian diving petrel. Since the taxonomic description of <i>P. georgicus whenuahouensis</i> from Whenua Hou / Codfish Island, it is thought these Sandfly Bay specimens may belong to <i>P. georgicus whenuahouensis</i> . While these specimens may have been beach wrecked individuals originating from other colonies, it was considered more likely they may have originated from a local colony (Wood & Briden 2008).
<i>Philesturnus carunculatus</i> Gmelin, 1789	South Island saddleback	tīeke	Recovering		CD, DPS, Inc, PF, RR	IUCN: Name and Authority, and Threat Status: <i>Pelecanoides georgicus whenuahouensis</i> Fischer et al., 2018. Critically Endangered Once found throughout Te Waipounamu / South Island and Rakiura / Stewart Island but predation by introduced mammals led to them becoming confined to the South Cape Islands by the 1960s. Subsequent successful or ongoing translocations have occurred. An attempt to establish a population at Orokonui Ecosanctuary – Te Korowai o Mihiwaka, near Ōtepoti Dunedin, in 2009 and 2013 was unsuccessful due to a stoat (<i>Mustela erminea</i>) incursion.
<i>Poliocephalus rufopectus</i> (G.R. Gray, 1843)	New Zealand dabchick	weweia	Nationally Increasing		DPS, Inc	IUCN: Name and Authority, Common Name and Threat Status: <i>Poliocephalus rufopectus</i> (Gray, 1843); New Zealand grebe; Least Concern. NPS-IB: listed Specified Highly Mobile Fauna Occurs from Northland to the north of the Te Waipounamu / South Island. Once sparingly distributed on small lakes and sheltered inlets on larger lakes in the Te Waipounamu / South Island, it declined in the 19 th century until becoming extinct there as a breeding species in the 1940s.
<i>Porphyrio hochstetteri</i> (A.B. Meyer, 1883)	South Island takahē	takahē	Nationally Vulnerable		CI, CD, RR	IUCN: Threat Status Endangered Once widespread in the Te Waipounamu / South Island, their range reduced to a relict population in the mountains of Te Rua-o-Te-Moko / Fiordland by the 1940s. The modern conservation programme has set up additional populations; a captive breeding and rearing facility at Burwood Bush near Te Anau, plus free-ranging populations on wildlife reserves on Te Ika-a-Māui / North Island and Te Waipounamu / South Island and several offshore islands. The taxon has two pairs at Orokonui Ecosanctuary – Te Korowai o Mihiwaka, near Ōtepoti Dunedin. In August 2023, 18 birds (9 pairs) were released in the Greenstone Valley, near Glenorchy, at the start of the breeding season. A further six sub-juveniles were released to reinforce the population in November 2023, with additional reinforcements occurring. Breeding has been recorded at both locations. Neither the Orokonui Ecosanctuary nor Greenstone Valley populations are self-sustaining yet.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Qualifiers	National Qualifiers	Notes
<i>Strigops habroptilus</i> Gray, 1845	kākāpō	kākāpō	Nationally Critical		CD, CR, Inc, RR	IUCN: Common Name and Threat Status: kakapo; Critically Endangered Once found throughout Aotearoa New Zealand, they disappeared from Te Ika-a-Māui / North Island by about 1930, persisting longer in Te Waipounamu / South Island until the late 1980s. Intensive management of the population has seen numbers increase in recent years.
<i>Thinornis novaeseelandiae</i> Gmelin, 1789	shore plover	tuturuatu*	Nationally Critical		Sp, CI, CD, CR, Inc, RR	IUCN: Name and Authority, Common Name and Threat Status: <i>Thinornis novaeseelandiae</i> (Gmelin, 1789); Endangered NPS-IB: listed Specified Highly Mobile Fauna Previously found around the coast of mainland Aotearoa New Zealand but were extirpated by about the 1870s and were confined to the Chatham Islands / Rēkohu / Wharekauri. The taxon has recently been released on islands around mainland Aotearoa New Zealand.
Taxonomically unresolved (2)						
<i>Anas chlorotis</i> "South Island" G.R. Gray, 1845	South Island brown teal	pāteke*	Data Deficient		PE	IUCN: Name and Authority, Common Name and Threat Status: <i>Anas chlorotis</i> Gray, 1845; brown teal; Near Threatened High likelihood of being functionally extinct due to hybridisation with mallards [Birdlife International, 2015; Checklist Committee]. Last recorded in the wild in 1999 (Heather & Robertson 2015).
<i>Apteryx</i> spp.	tokoeka spp.	tokoeka	Naturally Uncommon or Nationally Vulnerable		CD, CR, PD, RF	IUCN: Name and Authority, Common Name and Threat Status: <i>Apteryx australis</i> Shaw, 1813; southern brown kiwi; Vulnerable Tokoeka spp. were likely widespread throughout the southern and eastern part of Te Waipounamu / South Island as far north as North Canterbury / Waitaha, but their range contracted to Te Rua-o-Te-Moko / Fiordland, Haast Range and Rakiura / Stewart Island by the late 19 th century. Due to these disjunct populations of tokoeka, the result of postulated recent and ongoing population declines, the Department of Conservation – Te Papa Atawhai treat them as distinct management units (Burbidge et al. 2003; Weir et al. 2016; Germano et al. 2018; Bemmels et al. 2021; Scofield et al. 2021; Shepherd et al. 2021; Undin et al. 2021). Until further morphological and/or genetic research is undertaken, it is unclear whether the tokoeka which were found in Otago were more closely related to <i>Apteryx australis</i> "northern Fiordland" or <i>Apteryx australis</i> "southern Fiordland".

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Regionally Data Deficient (10)

Taxa that are suspected to be threatened or, in some instances, possibly extinct in Otago but are not definitely known to belong to any particular category due to a lack of current information about their distribution and abundance (for a fuller definition see Townsend et al. 2008).

Table 1.2: Regionally Data Deficient bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	National Qualifiers	Notes
DATA DEFICIENT (10)					
<i>Taxonomically determinate (10)</i>					
<i>Anas superciliosa</i> Gmelin, 1789	grey duck	pāpera	Nationally Vulnerable	CR, DPR, DPS, DPT, SO	IUCN: Common Name and Threat Status: pacific black duck; Least Concern. NPS-IB: listed Specified Highly Mobile Fauna. Extensively hybridised with introduced mallards to an extent that few pure grey ducks may exist in Aotearoa New Zealand. Although this is based on phenotype, as definitive genetic studies have yet to be undertaken, the diversity of soft part and plumage characteristics of most grey duck-like Aotearoa New Zealand birds compared to those in Australia support this belief. New Zealand Birds Online suggests the best opportunity to view grey duck is outside the Otago region in forested headwater catchments and away from human settlements.
<i>Eudyptula minor albosignata</i> Finsch, 1874	white-flipped blue penguin	kororā		CI, CD, CR, PD, RR	Checklist Committee: Name and Authority, and Common Name: <i>Eudyptula minor minor</i> J.R. Forster, 1781; New Zealand little penguin. IUCN: Name and Authority, Common Name and Threat Status: <i>Eudyptula minor</i> J.R. Forster, 1781; Little penguin; Least Concern. There are two subspecies currently recognised by the Checklist of the Birds of New Zealand (Checklist Committee, 2022): 1) Australian populations (<i>E. m. novaeollandiae</i>) and some Otago birds, and 2) all remaining populations including some Otago birds (<i>E. m. minor</i>). This second clade includes all birds previously assigned to <i>E. m. irredalei</i> (northern Aotearoa New Zealand), <i>E. m. variabilis</i> (Te Moana-o-Raukawa / Cook Strait), <i>E. m. albosignata</i> (the white-flipped penguin of North Canterbury), <i>E. m. chathamensis</i> (Chatham Islands / Rēkohu / Wharekauri), and some <i>E. m. minor</i> (southern Aotearoa New Zealand). <i>E. m. albosignata</i> was assigned Regionally Data Deficient due to this taxonomic uncertainty. Although the two clades are genetically distinguishable, they are not always readily identifiable in the field (Checklist Committee, 2022), and so the boundaries of their distributions and extent of sympatry in southern Aotearoa New Zealand is poorly known (Grosser et al. 2015, 2017). Little penguins are observed in Oamaru with varying degrees of white-flippedness; individuals of both the Australian and New Zealand clade breed together (Agnew pers. comm. July 2024).

Gray, 1845.</p> <p>A carcass from a beach-wrecked specimen was found from the western shore of Boulder Beach, Otago Peninsula / Muaūpoko, on 22 June 2011 (Rawlence et al. 2014). It is unknown if a breeding colony exists in Otago.</p>
<i>Pachyptila crassirostris crassirostris</i> Mathews, 1912	fulmar prion		Naturally Uncommon	CD, RR, St	<p>IUCN: Name and Authority, and Threat Status: <i>Pachyptila crassirostris</i> (Mathews, 1912); Least Concern.</p> <p>A poorly known species only easily seen by visiting its remote island breeding sites. While usually only easily identifiable in the hand, it has been seen east of the Te Waipounamu / South Island.</p>
<i>Procellaria parkinsoni</i> G.R. Gray, 1862	black petrel	tāiko	Nationally Vulnerable	CI, CD, CR, RR	<p>IUCN: Threat Status: Vulnerable</p> <p>While hard to distinguish at sea from the similar-looking Westland petrel / tāiko, it could visit Otago waters. A sighting off Taiaoro Head / Pukekura in October 2023 was regarded as 'probable' by the Birds New Zealand Records Appraisal Committee.</p>
<i>Pterodroma magentae</i> (Giglioli & Salvadori, 1869)	Chatham Island taiko	tāiko	Nationally Critical	CD, CR, Inc, IE, OL	<p>IUCN: Common Name and Threat Status: Magenta petrel; Critically Endangered.</p> <p>Recent tracking studies has improved understanding of the at-sea distribution of Chatham Island taiko / tāiko. A study from 2023 showed a bird off the Otago shelf, but not within Otago's Coastal Marine Area (Chamson, unpublished data, 2023). It is possible other birds could disperse into Otago waters.</p>
<i>Thalassarche bulleri platei</i> Rothschild, 1888	northern Buller's mollymawk	toroa	Naturally Uncommon	CI, CD, RR	<p>Checklist Committee: Name and Authority: <i>Thalassarche bulleri platei</i> (Reichenow, 1888).</p> <p>IUCN: Name and Authority, Common Name and Threat Status: <i>Thalassarche bulleri</i> (Rothschild, 1893); Buller's albatross; Near Threatened.</p> <p>A small albatross commonly occurring around coastal areas of Aotearoa New Zealand. Two subspecies, both extant: northern Buller's mollymawk (<i>T. bulleri platei</i>) and southern Buller's mollymawk / toroa (<i>T. b. bulleri</i>). While the southern Buller's mollymawk / toroa is regularly seen in the Otago Coastal Marine Area, it is uncertain if the northern Buller's mollymawk / toroa is found in the region due to identification challenges. The main area the northern subspecies ranges is off the Chatham Islands / Rēkohu / Wharekauri; and eastern Te Ika-a-Māui / North Island, but the taxon has been recorded in the subantarctic seas. Both subspecies migrate after breeding to the seas off Peru and Chile.</p>

<i>Thalassarche cauta cauta</i> Gould, 1841	Tasmanian albatross	toroa*	Vagrant	SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Thalassarche cauta</i> (Gould, 1841); Shy albatross; Near Threatened. A medium-sized albatross commonly occurring around Aotearoa New Zealand. Two subspecies, both extant: New Zealand white-capped mollymawk / toroa (<i>T. cauta steadii</i>) and Tasmanian albatross (<i>T. c. cauta</i>). While the New Zealand white-capped mollymawk / toroa is regularly seen in the Otago Coastal Marine Area, it is uncertain if the Tasmanian albatross is found in the region due to identification challenges. The main area they occur is around Tasmania and the South Indian Ocean. Both subspecies disperse after breeding through the South Pacific westwards as far as the South Atlantic Ocean.

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Regionally Threatened (32)

Taxa that meet the criteria specified by Townsend et al. (2008) and Michel (2021) for the categories Regionally Critical, Regionally Endangered, Regionally Vulnerable or Regionally Increasing.

Regionally Critical (9)

Criteria for Regionally Critical:

A – very small population (natural or unnatural)

A(1) < 250 mature individuals

A(2) ≤ 2 subpopulations, ≤ 200 mature individuals in the larger subpopulation

A(3) Total area of occupancy ≤ 1 ha (0.01 km²)

B – small population (natural or unnatural) with a moderate ongoing or predicted decline of 50–70%

B(1) 250–1000 mature individuals

B(2) ≤ 5 subpopulations, ≤ 300 mature individuals in the largest subpopulation

B(3) Total area of occupancy ≤ 10 ha (0.1 km²)

C – population (irrespective of size or number of subpopulations) with a very high ongoing or predicted decline of > 70%

Regional conservation status of birds in Otago

Table 1.3.1: Regionally Critical bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Criteria	National Stronghold	Regional Population	Regional Trend	Regional Confidence Population	Regional Confidence Trend	Regional Qualifiers	National Qualifiers	Notes
REGIONALLY CRITICAL (9)												
<i>Taxonomically determinate (9)</i>												
<i>Anarhynchus frontalis</i> Quoy & Gaimard, 1830	wrybill	ngutu pare	Nationally Increasing	A (1)		< 250	Stable: ±10 %	Low	Low	CD, DPS, DPT, NR, RR	CD, CR, RR	IUCN: Name and Authority, and Threat Status: <i>Anarhynchus frontalis</i> Quoy & Gaimard, 1830; Vulnerable. NPS-IB: listed Specified Highly Mobile Fauna Breeds only on Te Waipounamu / South Island. Most of the population breeds in Waitaha / Canterbury, and four rivers in Otago have populations: Hunter, Makarora, Matukituki, and Dart River / Te Awa Whakatipu. During their migration, flocks are often seen briefly on Te Waipounamu / South Island east coast lakes and estuaries. On their wintering grounds, they feed on intertidal mudflats in harbours and estuaries.
<i>Botaurus poiciloptilus</i> (Wagler, 1827)	Australasian bittern	matuku-hūrepo	Nationally Critical	A (1)		< 250	Decreasing: 50–70 %	Medium	High	CI, DPT, TO	Sp, CR, DPT, RF, TO	IUCN: Threat Status: Vulnerable. NPS-IB: listed Specified Highly Mobile Fauna Likely < 50 mature individuals. Difficult to detect, with females under-represented in counts.

Regionally Endangered (6)

Regional conservation status of birds in Otago

Criteria for Regionally Endangered:

A – small population (natural or unnatural) that has a low to high ongoing or predicted decline

A(1) 250–1000 mature individuals, predicted decline 10–50%

A(2) ≤ 5 subpopulations, ≤ 300 mature individuals in the largest subpopulation, predicted decline 10–50%

A(3) Total area of occupancy ≤ 10 ha (0.1 km²), predicted decline 10–50%

B – small stable population (unnatural)

B(1) 250–1000 mature individuals, stable population

B(2) ≤ 5 subpopulations, ≤ 300 mature individuals in the largest subpopulation, stable population

B(3) Total area of occupancy ≤ 10 ha (0.1 km²), stable population

C – moderate population and high ongoing or predicted decline

C(1) 1000–5000 mature individuals, predicted decline 50–70%

C(2) ≤ 15 subpopulations, ≤ 500 mature individuals in the largest subpopulation, predicted decline 50–70%

C(3) Total area of occupancy ≤ 100 ha (1 km²), predicted decline 50–70%

Table 1.3.2: Regionally Endangered bird taxa in Otago

Regional conservation status of birds in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. REGIONALLY ENDANGERED (6)												
<i>Taxonomically determinate (6)</i>												
<i>Chlidonias albobrostratus</i> (G.R. Gray, 1845)	black-fronted tern	tarapirohe*	Nationally Endangered	C (1)		1000–5000	Decreasing: 50–70 %	Low	Medium	CI, DPS, DPT, RR	Sp, CI, CR, PD, RF	IUCN: Threat Status: Endangered. NPS-IB: listed Specified Highly Mobile Fauna
<i>Eudynamis taitensis</i> (Sparman, 1787)	long-tailed cuckoo	koekoeā	Nationally Vulnerable	(1)		250–1000	Decreasing: 30–50 %	Low	ow	CI, CR, DPS, DPT	CI, CR, DPT	IUCN: Name and Authority, Common Name and Threat Status: <i>Urodynamis taitensis</i> (Sparman, 1787); Long-tailed koel; Vulnerable Co-extinction possible due to regional declines of host species (mohua and brown creeper / pipipi).
<i>Gallirallus australis hectori</i> (Hutton, 1873)	buff weka	weka	Relict	B (1)		250–1000	Stable: ±10 %	High	High	CD, RN		IUCN: Name and Authority, Common Name and Threat Status: <i>Gallirallus australis</i> Sparman, 1786; Weka; Vulnerable Formerly widespread in eastern low-rainfall areas from Marlborough / Te Taihū-o-te-Waka to Southland / Murihiku. Apparently died out on the mainland but remains abundant on Chatham Islands / Rēkohu / Wharekauri and Pitt Island / Rangihau / Rangiauria where they were introduced in 1905. Reintroduced to five islands in two lakes (Lake Wānaka and Lake Wakatipu / Whakatipu Waimāori) and a mainland site (Motatapu Valley) in Otago (Miskely & Powlesland 2013). Reintroduced populations are still present on the islands and individuals were present in the Motatapu Valley in 2021. Although a recent study inferred only one subspecies of weka for each of the main island in Aotearoa New Zealand (Trewick et al. 2017), the NZTCS taxonomy is followed in regional conservation status assessments so multiple lineages on Te Waipounamu / South Island were assessed in this report.

Regional conservation status of birds in Otago

Regionally Vulnerable (17)

Criteria for Regionally Vulnerable:

A – small, increasing population (unnatural)

- A(1) 250–1000 mature individuals, predicted increase > 10%
- A(2) ≤ 5 subpopulations, ≤ 300 mature individuals in the largest subpopulation, predicted increase > 10%
- A(3) Total area of occupancy ≤ 10 ha (0.1 km²), predicted increase > 10%

B – moderate, stable population (unnatural)

- B(1) 1000–5000 mature individuals, stable population
- B(2) ≤ 15 subpopulations, ≤ 500 mature individuals in the largest subpopulation, stable population
- B(3) Total area of occupancy ≤ 100 ha (1 km²), stable population

C – moderate population, with population trend that is declining

- C(1) 1000–5000 mature individuals, predicted decline 10–50%
- C(2) ≤ 15 subpopulations, ≤ 500 mature individuals in the largest subpopulation, predicted decline 10–50%
- C(3) Total area of occupancy ≤ 100 ha (1 km²), predicted decline 10–50%

D – moderate to large population and moderate to high ongoing or predicted decline

- D(1) 5000–20,000 mature individuals, predicted decline 30–70%
- D(2) ≤ 15 subpopulations, ≤ 1000 mature individuals in the largest subpopulation, predicted decline 30–70%
- D(3) Total area of occupancy ≤ 1000 ha (10 km²), predicted decline 30–70%

E – large population and high ongoing or predicted decline

- E(1) 20,000–100,000 mature individuals, predicted decline 50–70%
- E(2) Total area of occupancy ≤ 10,000 ha (100 km²), predicted decline 50–70%

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Regionally At Risk (4)

Taxa that meet the criteria specified by Townsend et al. (2008) and Michel (2021) for the statuses Regionally Declining, Regionally Recovering, Regionally Relict or Regionally Naturally Uncommon.

Regionally Declining (3)

Criteria for Regionally Declining:

A – moderate to large population and low ongoing or forecast decline of 10–30%

A(1) 5000–20,000 mature individuals

A(2) Total area of occupancy \leq 1000 ha (10 km²)

B – large population and low to moderate ongoing or forecast decline of 10–50%

B(1) 20,000–100,000 mature individuals

B(2) Total area of occupancy \leq 10,000 ha (100 km²)

C – very large population and low to high ongoing or forecast decline of 10–70%

C(1) > 100 000 mature individuals

C(2) Total area of occupancy > 10,000 ha (100 km²)

Regional conservation status of birds in Otago

Table 1.4.1: Regionally Declining bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Criteria	Regional Population	Regional Trend	Regional Confidence Population	Regional Confidence Trend	Regional Qualifiers	National Qualifiers	Notes
REGIONALLY DECLINING (3)											
<i>Taxonomically determinate (3)</i>											
<i>Bowdleria punctata punctata</i> Quoy & Gaimard, 1830	South Island fernbird	mātātā	Declining	A (1)	5000–20000	Decreasing: 10–30 %	Low	Low	DPS, DPT	CI, DPS, DPT	Checklist Committee: Name and Authority: <i>Poodytes punctatus punctatus</i> (Quoy & Gaimard, 1830) IUCN: Name and Authority, Common Name and Threat Status: <i>Poodytes punctatus</i> (Quoy & Gaimard, 1830); New Zealand fernbird; Least Concern. NPS-IB: listed Specified Highly Mobile Fauna
<i>Mohoua novaeseelandiae</i> (Gmelin, 1789)	brown creeper	pipipi	Not Threatened	A (1)	5000–20000	Decreasing: 10–30 %	Medium	Low	CR, DPS, DPT, PD		IUCN: Common Name and Threat Status: Pipipi; Least Concern. Found on Te Waipounamu / South Island and Rakiura / Stewart Island, persisting at sites that appear isolated from main populations (e.g., Naseby and the Maniototo plains, hills around Tahuna Queenstown, Pigeon Island / Wawahi Waka, Central Otago, and coastal Otago centred on Otepoti Dunedin). In Otago, possible cryptic decline based on abundance where mammalian predator control or elimination occurs. As the primary host for the long-tailed cuckoo / koekoëā on Waipounamu / South Island and Rakiura / Stewart Island, research could investigate the impact of decline on the parasitic cuckoos. The Partial Decline qualifier is due to Orokonui Ecosanctuary – Te Korowai o Mihiwaka, where introduced mammals have been eliminated except for the house mouse (<i>Mus musculus</i>).
<i>Zosterops lateralis lateralis</i> Latham, 1802	silveryeye	tauhou	Not Threatened	B (1)	20000–100000	Decreasing: 10–30 %	Medium	Low	CR, DPS, SO	SO	IUCN: Name and Authority, and Threat Status: <i>Zosterops lateralis</i> (Latham, 1801); Least Concern. NZ Garden Bird Survey shows a shallow decline regionally for the 10-year period from 2013–2023 and a moderate decline regionally for the 5-year period from 2018–2023, respectively, steeper than other parts of the country showing a decline. Additionally, disease events have occurred in Otago, hence the Conservation Research qualifier selected with this being a possible explanation for the decline.

Regional and national qualifiers: CD = Conservation Dependent; DPR = Data Poor Recognition; DPS = Data Poor Size; DPT = Data Poor Trend; DE = Designated; EF = Extreme Fluctuations; NR = Natural Range Limit; NS = National State; OL = One Location; PD = Partial Decline; RR = Range Restricted; SO = Secure Overseas; SO? = Secure Overseas?; S?O = Secure? Overseas; TO = Threatened Overseas; TO? = Threatened Overseas?; T?O = Threatened? Overseas; CI = Climate Impact; CRN = Conservation Research Needed; EW = Extinct in the Wild; INC = Increasing; PF = Population Fragmentation; PE = Possibly/Presumed Extinct; RE = Regional Endemic; Rel = Relict; RF = Recruitment Failure; Sp = Biologically Sparse; TL = Type Locality.

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Regionally Recovering (1)

Criteria for Regionally Recovering:

Taxa that have undergone a documented decline within the last 1000 years to a population size of 5000–20,000 mature individuals or a total area of occupancy of ≤ 1000 ha (10 km²) and now have an ongoing or predicted increase of > 10% in the total population or area of occupancy, taken over the next 10 years or three generations, whichever is longer. Taxa that are increasing but have a population size of < 5000 mature individuals (or total area of occupancy of < 100 ha) are listed in one of the Threatened categories, depending on their population size [for more details, see the description of Nationally Increasing above and Townsend et al. (2008)].

Table 1.4.2: Regionally Recovering bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Regionally Non-resident Native (135)

Taxa whose natural presence in Otago is either discontinuous (Regional Migrant) or sporadic or temporary (Regional Vagrant) or which have succeeded in recently (since 1950) establishing a resident breeding population (Regional Coloniser).

Regional Migrant (36)

Criteria for Regional Migrant:

Taxa that predictably and cyclically visit Otago as part of their normal life cycle (a minimum of 15 individuals known or presumed to visit per year), but do not breed here.

Table 1.5.1: Regional Migrant bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

<i>Catharacta macconnicki</i> (Saunders, 1893)	Antarctic skua		Migrant		SO	Checklist Committee: Name and Authority, and Common Name: <i>Stercorarius macconnicki</i> Saunders, 1893; south polar skua IUCN: Common Name and Threat Status: south polar skua; Least Concern.
<i>Charadrius leschenaultii leschenaultii</i> Lesson, 1826	greater sand plover		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Charadrius leschenaultii</i> Lesson, 1826. Greater sandplover. Least Concern.
<i>Charadrius mongolus</i> Pallas, 1776	Mongolian dotterel		Vagrant		SO	Checklist Committee: Common Name: lesser sand plover IUCN: Common Name and Threat Status: Siberian sandplover; Endangered.
<i>Charadrius obscurus obscurus</i> Gmelin, 1789	southern New Zealand dotterel	pukunui**	Nationally Critical	FR	CD, DPT, EF, OL	IUCN: Name and Authority, Common Name and Threat Status: <i>Charadrius obscurus</i> Gmelin, 1789; southern red-breasted plover; critically Endangered. NPS-IB: listed Specified Highly Mobile Fauna. Extirpated from Te Waipounamu / South Island by about 1900 following introduction of mustelids. Breeding range now confined to Rakiura / Stewart Island, with taxon being conservation dependent.
<i>Charadrius ruficapillus</i> Temminck, 1821	red-capped dotterel		Vagrant		SO	Checklist Committee: Common Name: red-capped plover IUCN: Name and Authority, Common Name and Threat Status: <i>Charadrius ruficapillus</i> Temminck, 1822; red-capped plover; Least Concern.
<i>Chenonetta jubata</i> Latham, 1802	Australian wood duck		Coloniser		SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Chenonetta jubata</i> (Latham, 1801); maned duck; Least Concern.
<i>Chlidonias hybridus javanicus</i> Horsfield, 1821	whiskered tern		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Chlidonias hybridus</i> (Pallas, 1811); Least Concern.
<i>Chlidonias leucopterus</i> (Temminck, 1815)	white-winged black tern		Migrant		SO	IUCN: Common Name and Threat Status: white-winged tern. Least Concern.
<i>Coprotheres pomarinus</i> (Temminck, 1815)	pomarine skua		Migrant		SO	Checklist Committee: Name and Authority: <i>Stercorarius pomarinus</i> (Temminck, 1815). IUCN: Common Name and Threat Status: pomarine jaeger; Least Concern.
<i>Coracina novaehollandiae</i> (Gmelin, 1789)	black-faced cuckoo-shrike		Vagrant		SO	IUCN: Common Name and Threat Status: black-faced cuckooshrike. Least Concern.
<i>Cuculus optatus</i> Gould, 1845	oriental cuckoo		Vagrant		SO	IUCN: Threat Status: Least Concern.
<i>Cuculus pallidus</i> (Latham, 1801)	pallid cuckoo		Vagrant		SO	Checklist Committee: Name and Authority: <i>Cacomantis pallidus</i> (Latham, 1802). IUCN: Threat Status: Least Concern.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Qualifiers	National Qualifiers	Notes
<i>Dacelo novaeguineae</i> Hermann, 1783	laughing kookaburra		Introduced and Naturalised		RR, SO	Checklist Committee: Name and Authority: <i>Dacelo novaeguineae novaeguineae</i> Hermann, 1783. IUCN: Name and Authority, and Threat Status: <i>Dacelo novaeguineae novaeguineae</i> (Hermann, 1783); Least Concern. Introduced in Otago between the 1860s and 1880, but a population never established. Sightings of single birds have subsequently been recorded in Otago, either from naturalised Northland population or possibly from Australia, being regarded as vagrants (Heather & Robertson 2015). Included as Regionally Vagrant in Otago due to uncertainty of where individuals in the region came from
<i>Dendrocygna eytoni</i> Eyton, 1838	plumed whistling duck		Vagrant		SO	IUCN: Name and Authority, and Threat Status: (<i>Dendrocygna eytoni</i> Eyton, 1838); Least Concern.
<i>Diomedea exulans</i> Linnaeus, 1758	wandering albatross	toroa	Migrant		TO	IUCN: Threat Status: Vulnerable.
<i>Egretta garzetta immaculata</i> Linnaeus, 1766	little egret		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Egretta garzetta</i> (Linnaeus, 1766); Least Concern.
<i>Egretta sacra sacra</i> Gmelin, 1789	reef heron	matuku moana	Nationally Endangered		Sp, CI, CR, DPT, SO	IUCN: Common Name and Threat Status: <i>Egretta sacra</i> (Gmelin, 1789). Pacific reef-egret. NPS-IB: listed Specified Highly Mobile Fauna. Possibly breeding but not confirmed.
<i>Eseyornis melanops</i> (Vieillot, 1818)	black-fronted dotterel		Naturally Uncommon		SO, Sp	IUCN: Threat Status: Least Concern.
<i>Eudyptes chrysocome</i> J.R. Forster, 1781	western rockhopper penguin	tawaki piki toka*	Vagrant		TO	IUCN: Name and Authority, Common Name and Threat Status: <i>Eudyptes chrysocome</i> (Forster, 1781); southern rockhopper penguin; Vulnerable.
<i>Eudyptes fiillholi</i> Hutton, 1879	eastern rockhopper penguin	tawaki piki toka	Nationally Vulnerable		CI, CD, CR, DPT, RR, TO	IUCN: Name and Authority, Common Name and Threat Status: <i>Eudyptes chrysocome</i> (Forster, 1781); southern rockhopper penguin; Vulnerable. 1 or 2 individuals most years.
<i>Eudyptes robustus</i> Oliver, 1953	Snares crested penguin	pokotiwha	Naturally Uncommon		CD, IE, OL	IUCN: Threat Status: Vulnerable. Up to 5 individuals each year.
<i>Eudyptes schlegelii</i> Finsch, 1876	royal penguin		Vagrant		TO	IUCN: Threat Status: Least Concern. 1 or 2 individuals most years.
<i>Eudyptes sclateri</i> Buller, 1888	erect-crested penguin	tawaki nana hi	Declining		CI, CD, CR, PD, RR	IUCN: Threat Status: Endangered. Up to 10 individuals each year.
<i>Eurystomus orientalis pacificus</i> (Latham, 1802)	dollarbird		Vagrant		SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Eurystomus orientalis</i> (Latham, 1766); oriental dollarbird; Least Concern.
<i>Falco cenchroides cenchroides</i> Vigors & Horsfield, 1827	Nankeen kestrel		Vagrant		SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Falco cenchroides</i> Vigors & Horsfield, 1827; Nankeen kestrel; Least Concern.
<i>Fregata ariel ariel</i> G.R. Gray, 1845	lesser frigatebird		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Fregata ariel</i> (Gray, 1845); Least Concern.
<i>Gallinago hardwickii</i> J.E Gray, 1831	Japanese snipe		Vagrant		SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Gallinago hardwickii</i> (Gray, 1831); Latham's snipe; Least Concern.
<i>Gallinula chloropus</i> Linnaeus, 1758	common moorhen		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Gallinula tenebrosa</i> (Linnaeus, 1758); Least Concern.
<i>Gallinula tenebrosa</i> Gould, 1846	dusky moorhen		Vagrant		SO	IUCN: Threat Status: Least Concern.
<i>Halobaena caerulea</i> (Gmelin, 1789)	blue petrel		Migrant		SO	IUCN: Threat Status: Least Concern.

<i>Himantopus novaezelandiae</i> Gould, 1841	black stilt	kakī	Nationally Critical	FR	CD, CR, RR	IUCN: Threat Status: Critically Endangered. NPS-IB: listed Specified Highly Mobile Fauna. Formerly widespread throughout Aotearoa New Zealand. During the 20 th century the range contracted confined to Waitaha / Canterbury and Otago in the 1950s, South Canterbury-North Otago by the 1970s, and the Mackenzie Basin / Te Manahuna by the 1980s. Breeding pairs are now confined to the area between the Lake Tekapo and Lake Pukaki basins in the north to the Ahuriri River in the south. Outside the breeding season most black stilt / kakī move locally within the Mackenzie Basin / Te Manahuna, but <10 individuals visit Otago each year.
<i>Hirundapus caudacutus caudacutus</i> Latham, 1802	white-throated needletail		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Hirundapus caudacutus</i> (Latham, 1802). Least Concern.
<i>Lalage tricolor</i> Swainson, 1825	white-winged triller		Vagrant		SO	IUCN: Name and Authority, and Threat Status: <i>Lalage tricolor</i> (Swainson, 1825). Least Concern.
<i>Larus pipixcan</i> Wagler, 1831	Franklin's gull		Vagrant		SO	Checklist Committee: Name and Authority: <i>Leucophaeus pipixcan</i> (Wagler, 1831). IUCN: Threat Status: Least Concern.
<i>Limosa haemastica</i> (Linnaeus, 1758)	American black-tailed (Hudsonian) godwit		Vagrant		SO	Committee Checklist: Common Name: Hudsonian godwit. IUCN: Common Name and Threat Status: Hudsonian godwit; Least Concern.
<i>Lugensa brevirostris</i> (Lesson, 1833)	Kerguelen petrel		Migrant		SO	IUCN: Threat Status: Least Concern.
<i>Milvus migrans</i> (Boddaert, 1783)	black kite		Vagrant		SO	IUCN: Threat Status: Least Concern.
<i>Numenius madagascariensis</i> Linnaeus, 1766	eastern curlew		Vagrant		TO	IUCN: Name and Authority, Common Name and Threat Status: <i>Numenius madagascariensis</i> (Linnaeus, 1766); far eastern curlew; Endangered.
<i>Numenius phaeopus variegatus</i> (Scopoli, 1786)	Asiatic whimbrel		Migrant		SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Numenius phaeopus</i> (Linnaeus, 1758); whimbrel; Least Concern.
<i>Nycticorax caledonicus australasiae</i> Gmelin, 1789	Nankeen night heron	umu kōtuku	Coloniser		DPS, DPT, OL, SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Nycticorax caledonicus</i> (Gmelin, 1789); Rufous night-heron; Least Concern.
<i>Oceanodroma leucorhoa leucorhoa</i> Vieillot, 1818	Leach's storm petrel		Vagrant		SO	Checklist Committee: Name and Authority: <i>Hydrobates leucorhoa leucorhoa</i> (Vieillot, 1818). IUCN: Name and Authority, and Threat Status: <i>Oceanodroma leucorhoa</i> (Vieillot, 1818); Vulnerable.
<i>Pachyptila belcheri</i> (Mathews, 1912)	thin-billed prion	korotangi	Migrant		SO	IUCN: Common Name and Threat Status: slender-billed prion. Least Concern.
<i>Pachyptila desolata</i> Gmelin, 1789	Antarctic prion	totorore	Relict		CD, CR, DPS, DPT, RR, SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Pachyptila desolata</i> (Gmelin, 1789); Least Concern.
<i>Pachyptila salvini</i> Mathews, 1912	Salvin's prion		Migrant		SO	IUCN: Threat Status: Least Concern.
<i>Petrochelidon ariel</i> (Gould, 1843)	fairy martin		Vagrant		SO	IUCN: Threat Status: Least Concern.
<i>Petrochelidon nigriceps</i> (Vieillot, 1817)	tree martin		Vagrant		SO	IUCN: Threat Status: Least Concern.
<i>Phalacrocorax sulcirostris</i> (Brandt, 1837)	little black shag	kawau tū	Naturally Uncommon		RR	IUCN: Common Name and Threat Status: little black cormorant; Least Concern.
<i>Phalaropus fulicarius</i> (Linnaeus, 1758)	grey phalarope		Vagrant		SO	IUCN: Common Name and Threat Status: red phalarope; Least Concern.
<i>Phoebastria palpebrata</i> J.R. Forster, 1785	light-mantled sooty albatross	toroa pango	Nationally Vulnerable		CI, CD, CR, DPS, DPT, RR, TO	IUCN: Name and Authority, Common Name and Threat Status: <i>Phoebastria palpebrata</i> (Forster, 1785); light-mantled albatross; Near Threatened. Annual visitor to mainland Aotearoa New Zealand waters, but few enter Otago's Coastal Marine Area. A sighting near Taiaroa Head / Pukekura was on December 16, 2016.
<i>Plegadis falcinellus</i> (Linnaeus, 1766)	glossy ibis		Coloniser		OL, SO	IUCN: Threat Status: Least Concern.

Regional conservation status of birds in Otago

Regional Coloniser (2)

Criteria for Regional Coloniser:

Taxa that otherwise trigger 'Threatened' categories because of small population size, but have arrived without direct or indirect help from humans and have been successfully reproducing in the wild since 1950.

Table 3.5.3: Regional Coloniser bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN, 2024-1) Red List of Threatened Species; and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System. If the taxon is a specified highly mobile fauna as listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) it is noted.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	Regional Qualifiers	National Qualifiers	Notes
REGIONAL COLONISER (2)						
<i>Taxonomically determinate (2)</i>						
<i>Fulica atra australis</i> Gould, 1845	Australian coot		Naturally Uncommon	Inc, SO	Inc, SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Fulica atra</i> Linnaeus, 1758; common coot; Least Concern. Self-introduced to Aotearoa New Zealand from Australia in the 20 th century, and was first recorded breeding in Aotearoa New Zealand on Lake Hayes / Waiwhakaata, Otago in 1958. There are an estimated 1000–5000 mature individuals in Otago, with an increasing population > 10 %.
<i>Platalea regia</i> Gould, 1838	royal spoonbill	kōtuku ngutupapa	Naturally Uncommon	RR, SO	Inc, RR, SO, Sp	IUCN: Threat Status: Least Concern. First reported in Aotearoa New Zealand at Castlepoint / Rangihakaoma, Wairarapa, in 1861 (Buller 1869). Breeding in south Westland was suspected in mid-1940s (Stidolph 1948) and confirmed at Waitangiroto white heron / kōtuku colony in 1949 (Oliver 1955). The species has subsequently spread, with breeding reported including in Otago, for example, at Maukiekie Island, Moeraki, 1983–84 (P. Schweigman in Marchant & Higgins 1990); Green Island, Ōtepoti Dunedin, 1988 (P. Schweigman in Marchant & Higgins 1990); Nugget Point / Tokatā, 1995; Taieri Island / Moturata, 1997; Heywood Point, Otago, 2003 (Schweigman 2006); Taiaroa Head / Pukekura, 2004; and the Catlins, 2004 (Schweigman 2006).

Regional and national qualifiers: CD = Conservation Dependent; DPR = Data Poor Recognition; DPS = Data Poor Size; DPT = Data Poor Trend; DE = Designated; EF = Extreme Fluctuations; NR = Natural Range Limit; NS = National State; OL = One Location; PD = Partial Decline; RR = Range Restricted; SO = Secure Overseas; SO? = Secure Overseas?; S?O = Secure? IUCN: Name and Authority, Common Name and Threat Status: <i>Eudyptula minor</i> J.R. Forster, 1781; Little penguin; Least Concern There are two subspecies recognised by the Checklist of the Birds of New Zealand (Checklist Committee, 2022): 1) Australian populations (<i>E. m. novaehollandiae</i>) and some Otago birds, and 2) all remaining populations including some Otago birds (<i>E. m. minor</i>). This second clade includes all birds previously assigned to <i>E. m. iradaleri</i> (northern Aotearoa New Zealand), <i>E. m. variabilis</i> (Te Moana-o-Raukawa / Cook Strait), <i>E. m. albosignata</i> (the white-flipped penguin of North Canterbury), <i>E. m. chathamensis</i> (Chatham Islands / Rēkohu / Wharekauri), and some <i>E. m. minor</i> (southern Aotearoa New Zealand). Southern Australia (including Tasmania) and mainly Otago in Aotearoa New Zealand (Grosser et al. 2015). The arrival of this taxon in Aotearoa New Zealand post-dates human settlement (Grosser et al. 2016).
<i>Gerygone igata</i> (Quoy & Gaimard, 1830)	grey warbler	riroriro	Not Threatened	Stable: ±10 %	Medium	Low			IUCN: Common Name and Threat Status: grey gerygone. Least Concern
<i>Hemiphaga novaeseelandiae</i> Gmelin, 1789	kererū / New Zealand pigeon	kererū	Not Threatened	Stable: ±10 %	Low	Medium	DPT	CD, De, Inc	IUCN: Name and Authority, and Threat Status: <i>Hemiphaga novaeseelandiae</i> (Gmelin, 1789); Least Concern. NZ Garden Bird Survey indicates a moderate decline in Otago in 5 years from 2018–2023, contrasting to the shallow increase for the 10-year period from 2013–2023. Nationally, there was a shallow increase for the 10-year period from 2013–2023 and a shallow decline for the 5-year period from 2018–2023. Trends indicate some variation across the region.
<i>Himantopus himantopus leucocephalus</i> Gould, 1837	pied stilt	poaka	Not Threatened	Stable: ±10 %	High	Medium	SO	SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Himantopus himantopus</i> (Linnaeus, 1758); black-winged stilt; Least Concern
<i>Hirundo neoxena neoxena</i> Gould, 1842	welcome swallow	warou	Not Threatened	Stable: ±10 %	Medium	Low	SO	SO, St	IUCN: Name and Authority, and Threat Status: <i>Hirundo neoxena</i> Gould, 1842; Least Concern
<i>Larus dominicanus dominicanus</i> Lichtenstein, 1823	southern black-backed gull	karoro	Not Threatened	Stable: ±10 %	High	Low	DPS, SO	SO	Committee Checklist: Name and Authority: <i>Larus dominicanus</i> Lichtenstein, 1823. IUCN: Common Name and Threat Status: kelp gull; Least Concern.
<i>Petroica macrocephala macrocephala</i> Gmelin, 1789	South Island tomtit	ngirungiru	Not Threatened	Stable: ±10 %	Medium	Low	DPS		IUCN: Name and Authority, Common Name and Threat Status: New Zealand tomtit. <i>Petroica macrocephala</i> (Gmelin, 1789); Least Concern
<i>Porphyrio melanotus melanotus</i> Temminck, 1820	pukeko	pūkeko	Not Threatened	Stable: ±10 %	Medium	Low	SO	Inc, SO	IUCN: Name and Authority, Common Name and Threat Status: <i>Porphyrio porphyrio</i> (Linnaeus, 1758). Purple swamphen. Least Concern

Regional conservation status of birds in Otago

Regional Conservation Translocations (3)

Taxa that have been intentionally moved and released to Otago where the primary objective is a conservation benefit but have not established self-sustaining populations. Conservation translocations consist of (i) population restoration, comprising reinforcement and reintroduction within a species' indigenous range, and (ii) conservation introductions, comprising assisted migration and ecological replacement, outside indigenous range.

Table 1.7: Regional conservation translocations of bird taxa in Otago

Name and authority, common name, and threat status from International Union for Conservation of Nature (IUCN) Red List of Threatened Species and name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System as used in this report.

CONSERVATION TRANSLOCATIONS (3)										
REINTRODUCTION (2)										
<i>Taxonomically determinate (2)</i>										
<i>Gallirallus australis hectori</i> (Hutton, 1873)	buff weka	weka	Relict	250–1000	Stable: ±10 %	High	High	CD, RN		IUCN: Name and Authority, Common Name and Threat Status: <i>Gallirallus australis</i> Sparman, 1786; Weka; Vulnerable. Reintroduced to five islands in two lakes (Lake Wānaka and Lake Wakatipu / Whakatipu Waimāori) in and a mainland site (Motatapu Valley) Otago (Miskelly & Powlesland 2013). Reintroduced populations are still present on the islands and individuals were in the Motatapu Valley in 2021.
<i>Porphyrio hochstetteri</i> (A.B. Meyer, 1883)	South Island takahē	takahē	Nationally Vulnerable	~24		High		CD, CI	CI, CD, RR	IUCN: Threat Status: Endangered. Two pairs currently at Orokonui Ecosanctuary – Te Korowāi o Mihiwaka; they are free roaming with one pair in the upper sanctuary separated by a low fence from the other pair in the lower sanctuary due to their being defensive about territories. Due to lack of habitat, a self-sustaining population is not possible. The sanctuary is an important advocacy site for takahē. In August 2023, 18 takahē (nine pairs) were released into the Greenstone Valley, near Glenorchy at the head of Lake Wakatipu / Whakatipu Waimāori. A further six juveniles were released in November 2023, with ongoing reinforcements planned.

<i>Taxonomically unresolved (1)</i>										
<i>Apteryx australis</i> "Haast"	Haast tokoeka	tokoeka*	Nationally Vulnerable	~35	Increasing: >10 %	High	High	CD, IN, Inc, OL	CD, Inc, OL, RF	IUCN: Name and Authority, Common Name and Threat Status: <i>Apteryx australis</i> Shaw, 1813; southern brown kiwi; Vulnerable First released in 2010 at Orokonui Ecosanctuary – Te Korowai o Mihiwaka. Since 2015 the sanctuary has been used as a kiwi crèche as part of the Operation Nest Egg where chicks are raised before release into the wild, while the lower sanctuary where tokoeka were first released is a free-roaming population. The population of Haast tokoeka in the lower sanctuary is currently estimated to be ~35 birds (E. Smith, pers. comm.). Given that tokoeka spp. are long-lived with a lengthy generation time, the population is not yet considered self-sustaining.

Regional conservation status of birds in Otago

Regionally Introduced, Not Established (10)

Taxa observed in a region where a: 1) release is documented, but with no record of self-sustaining population in the wild; or 2) a deliberate introduction is documented, and published records indicate the species bred (or probably bred), but it is no longer extant.

Table 1.9: Introduced, not established bird taxa in Otago

Name and authority, and common name from Checklist of the Birds of New Zealand (Checklist Committee, 2022) are provided where they differ from the New Zealand Threat Classification System as used in this report.

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	National Qualifiers	Regional Population	Regional Confidence Size	Notes
INTRODUCED, NOT ESTABLISHED (10)							
<i>Taxonomically determinate (10)</i>							
<i>Cairina moschata</i> (Linnaeus, 1758)	muscovy duck						Feral individuals reported from Aotearoa New Zealand, including in the Otago.
<i>Cereopsis novaehollandiae</i> Latham, 1801	Cape Barren goose		Introduced and Naturalised	SO, Sp	<250	High	Liberated at Lake Hawea in 1914, where it survived as a small population in the Hawea, Wānaka, and Hunter River area until about 1946 (Williams 1968). Incidental records (e.g., Owaka, 2004; Catlins River, 2011) are also most likely to be escapees from private waterfowl collections.
<i>Chrysolophus pictus</i> (Linnaeus, 1758)	golden pheasant						Introduced to Aotearoa New Zealand, including by Otago Acclimatisation Society.
<i>Cygnus olor</i> (Gmelin, 1789)	mute swan	wāna	Introduced and Naturalised	SO, Sp	<250	High	Introduced to Aotearoa New Zealand during the 19 th century, including in Otago (1868–1869). Although no known populations, single individuals are regularly reported.
<i>Eolophus roseicapillus</i> (Vieillot, 1817)	galah		Introduced and Naturalised	RR, SO	<250	High	Checklist Committee: Name and Authority: <i>Eolophus roseicapilla</i> (Vieillot, 1817). Present in Aotearoa New Zealand as a cage-bird. Small population in South Tāmaki Makaurau / Auckland, with presumed escapees recorded elsewhere (e.g., Robertson et al. 2007).
<i>Gallus gallus gallus</i> (Linnaeus, 1758)	feral chicken		Not assessed	SO			Assessed as Introduced and Naturalised in earlier versions of the national assessment but removed from the 2021 national assessment. While known to breed in the wild in Aotearoa New Zealand, no viable wild populations have been established and most enclaves are supplemented by ongoing releases and/or supplementary feeding (Heather & Robertson 2015).
<i>Numida meleagris</i> Linnaeus, 1758	helmeted guineafowl		Introduced and Naturalised	SO, Sp	<250	High	Introduced to Waitaha / Canterbury, in the 1860s, and subsequently elsewhere. Wild populations present in rough farmland in a few Aotearoa New Zealand localities (Robertson et al. 2007).
<i>Nymphicus hollandicus</i> (Kerr, 1792)	cockatiel						
<i>Pavo cristatus</i> Linnaeus, 1758	peafowl	pikao	Introduced and Naturalised	SO	250–1000	Low	Introduced to Aotearoa New Zealand from 1843 (Thomson 1922). Increasingly common in Northland, western Firth of Thames, Coromandel / Kapanga, Rotorua district, Bay of Plenty / Te Moana-a-Toi, East Cape, King Country, Taranaki, Whanganui district, Tairāwhiti / Gisborne, Mahia, and Hawke's Bay, with some records from north-west Nelson / Whakatū, Marlborough / Te Taihū-o-te-Waka, and Waitaha / Canterbury (Robertson et al. 2007) and Otago.
<i>Streptopelia risoria</i> Linnaeus, 1758	Barbary dove		Introduced and Naturalised	SO, Sp	<250	High	Introduced to Nelson / Whakatū, in 1867, and later to Waitaha / Canterbury and Ōtepoti Dunedin (Thomson 1922). There have been a few Te Waipounamu / South Island sightings (Robertson et al. 2007).

Regional and national qualifiers: CD = Conservation Dependent; DPR = Data Poor Recognition; DPS = Data Poor Size; DPT = Data Poor Trend; DE = Designated; EF = Extreme Fluctuations; NR = Natural Range Limit; NS = National State; OL = One Location; PD = Partial Decline; RR = Range Restricted; SO = Secure Overseas; SO? = Secure Overseas?; S?O = Secure? Regional conservation status of birds in Otago

Regionally Not Assessed (2)

Taxa that have been assessed in national assessments in the past but are not assessed in this report

Table 1.10: Not assessed bird taxa in Otago

Name and Authority	Common Name	Māori Name from National Conservation Status	National Conservation Status	National Qualifiers	Notes
NOT ASSESSED (2)					
<i>Taxonomically determinate (2)</i>					
<i>Platycercus elegans</i> (Gmelin, 1788)	crimson rosella	kākā uhi whero*			Assessed as Introduced and Naturalised in earlier versions of the national assessment. However, a breeding population of this species in Ōtepoti Dunedin died out in the 1950s, the small breeding population in Pōneke / Wellington city appears to have died out in the early 2000s, and the few birds that have been seen elsewhere in the country are probably recent cage escapees (Heather & Robertson 2015). The national panel assessed that the species is no longer naturalised in Aotearoa New Zealand and so removed it from the 2021 list.
<i>Spheniscus magellanicus</i> (Forster, 1781)	Magellanic penguin			SO	Two Aotearoa New Zealand records, with one in Otago on March 1990, from Otago Harbour (Darby 1991; Guest 1991). Magellanic penguins are typically timid; the bold behaviour of both these birds indicated previous habituation to humans, and so they may have reached Aotearoa New Zealand by ship (Darby 1991; Guest 1991) Excluded from the latest national assessment, because its occurrence in Aotearoa New Zealand is regarded as a failed introduction rather than as a vagrant (Gill et al. 2010).

Regional and national qualifiers: CD = Conservation Dependent; DPR = Data Poor Recognition; DPS = Data Poor Size; DPT = Data Poor Trend; DE = Designated; EF = Extreme Fluctuations; NR = Natural Range Limit; NS = National State; OL = One Location; PD = Partial Decline; RR = Range Restricted; SO = Secure Overseas; SO? = Secure Overseas?; S?O = Secure? Overseas; TO = Threatened Overseas; TO? = Threatened Overseas?; T?O = Threatened? Overseas; CI = Climate Impact; CRN = Conservation Research Needed; EW = Extinct in the Wild; INC = Increasing; PF = Population Fragmentation; PE = Possibly/Presumed Extinct; RE = Regional Endemic; Rel = Relict; RF = Recruitment Failure; Sp = Biologically Sparse; TL = Type Locality.

*Most common Māori name used in the *Notornis* scientific journal as cited in Checklist Committee (2022). Alternatives name provided in Appendix 3 of the Checklist.

Regional conservation status of birds in Otago

Figure 1: Regional conservation status of birds in the Otago Region.

Although 43 bird species were Regionally Extirpated, two species have been reintroduced to the region and another species has had an assisted migration so there is a total of three extant species with conservation translocations into Otago.

Regional conservation status of birds in Otago

Table 2: Presence of Regionally Threatened, Regionally At Risk, Regionally Non-resident (Migrant and Coloniser only), Regionally Introduced and Naturalised, and Regionally Conservation Translocated bird taxa by territorial authority or Coastal Marine Area in the Otago Region. The Coastal Marine Area extends from mean high water springs out to the 12 nautical mile (22.2 kilometre) limit of the territorial sea, from the Waitaki River in the north to Wallace Beach in the south. *B* indicates a taxon has been observed breeding in a territorial authority over the last 20 years; *SB* indicates a taxon is suspected to breed in a territorial authority; *P* indicates a taxon was observed to be present in a territorial authority or the Coastal Marine Area; *SP* indicates a taxon is suspected to be present in a territorial authority or the Coastal Marine Area. The Māori name is from the National Conservation Status, except when from Checklist of the Birds of New Zealand as indicated by an asterisk (*)

Regional conservation status of birds in Otago

Table 3: Presence of Regionally Threatened, Regionally At Risk, Regionally Non-resident (Migrant and Coloniser only), Regionally Introduced and Naturalised, and Regionally Conservation Translocated bird taxa in freshwater management units (FMU) in the Otago Region. The Clutha Mata-au FMU has been further subdivided into five rohe (areas). *B* indicates a taxon has been observed breeding in a FMU or rohe over the last 20 years; *SB* indicates a taxon is suspected to breed in a FMU or rohe; *P* indicates a taxon was observed in a FMU or rohe; *SP* indicates a taxon is suspected in a FMU or rohe. The Māori name is from the National Conservation Status, except when from Checklist of the Birds of New Zealand as indicated by an asterisk (*)

 Regional conservation status of birds in Otago

Discussion

Regional threat assessments have been completed by regional or unitary councils in Aotearoa New Zealand, including by the Otago Regional Council. This report is the first regional conservation status for birds in the Otago Region. A total of 283 bird taxa were identified as in, or near, the Otago since human arrival in Aotearoa New Zealand (Figure 1). Of these taxa, 32 are Regionally Threatened, four are Regionally At Risk, 135 are Regionally Non-resident, 22 are Regionally Not Threatened; 10 are Regionally Data Deficient; and 25 taxa were Introduced and Naturalised. Additionally, 43 taxa are identified as Regionally Extirpated, 10 taxa were Introduced, Not Established, and two are Not Assessed. Conservation Translocations to reintroduce or introduce three bird species to the region have happened for conservation purposes.

For 32 Regionally Threatened taxa in the Otago region, nine are Regionally Critical, six are Regionally Endangered, and 17 are Regionally Vulnerable. Of the four Regionally At Risk taxa, three are Regionally Declining and one is Regionally Recovering. The number of Regionally Not Threatened taxa is 22. For Regionally Non-resident Native species, 36 are Regional Migrants, 97 are Regional Vagrants, and two are identified as a Regional Coloniser. In Otago 43 were identified as Regionally Extirpated, with 30 taxa globally extinct and 13 taxa extant but extinct from the region.

Regionally extirpated bird taxa

The number of extirpated bird taxa in Otago is at least 43, including 13 regional extirpations and 30 national extinctions (Table 1.1). Of the 13 regional extirpations, two are considered nationally as Data Deficient and 10 are Threatened or At Risk. Of the 30 global extinctions, seven were for species of moa (order Dinornithiformes); six were ducks, swan, goose, and merganser (order Anseriformes); six were for wrens, a raven, and a piopio (order Passeriformes); three were adzebill and rallidae (order Gruiformes); two were for an eagle and a harrier (order Accipitriformes); one for a penguin (order Sphenisciformes); one for an owllet-nightjar (order Apodiformes); one for a bittern (order Pelecaniformes); one for an owl (order Strigiformes); one for a snipe (order Charadriiformes); and one for a quail (order Galliformes). While most of the extinct taxon have fossil records from Otago, three were assumed to have occurred in the region (crested moa, *Pachyornis australis*, long-billed wren, long-billed wren, and the South Island stout-legged wren, *Pachyplichas yaldwyni*). This is based on a disjunct distribution of deposits on either side of Otago and presumed suitable habitat in the region. Although the New Zealand swan, *Cygnus sumnerensis*, was not assessed in the national assessment by Robertson et al. (2021), it is a confirmed extinct taxon (Rawlence et al. 2017, 2018) in the Checklist of the Birds of New Zealand (Checklist Committee, 2022).

Regional conservation status of birds in Otago

Regionally Data Deficient bird taxa

The Otago region has 10 Regionally Data Deficient bird taxa (Table 1.2), who were assigned to this category for two main reasons. First, *uncertain taxonomy* for four taxa: 1) the grey duck / pāpera, *Anas superciliosa*, has extensively hybridised with introduced mallards to the extent that few grey ducks / pāpera may exist in Aotearoa New Zealand, and the Otago region is not considered a stronghold for potentially pure grey ducks; 2) only two subspecies of blue penguins / kororā are recognised by the Checklist of the Birds of New Zealand (Checklist Committee, 2022) but it's unclear whether the southern blue penguin / kororā, *Eudyptula minor minor*, as in the NZTCS taxonomy are in the region (Grosser et al. (2015, 2017); 3) similarly for white-flipped blue penguin / kororā, *Eudyptula minor albosignata*, there are only two subspecies of blue penguins recognised by the Checklist of the Birds of New Zealand (Checklist Committee, 2022), but varying degrees of white-flippedness are observed at Ōamaru (Agnew pers. comm. July 2024); and 4) the discovery of a carcass from a recently dead bird at Boulder beach, Otago Peninsula / Muaūpoko, that resembled a Foveaux shag / mapo, *Leucocarbo stewarti*.

Second, *uncertainty over distributional range limits* for six taxa; one was for terrestrial bird while the remaining five were for seabirds. For the western weka / weka, *Gallirallus australis australis*, there was uncertainty whether populations are found in the region despite being present in adjacent areas such as Eglinton Valley; for northern Buller's mollymawk / toroa, *Thalassarche bulleri platei*, there was uncertainty whether they are found in the region despite being recorded in adjacent seas; for Chatham Island taiko / tāiko, *Pterodroma magentae*, there was uncertainty they are found in the region despite recent tracking studies showing that they forage near the Otago canyons; for the fulmar prion, *Pachyptila crassirostris*, there was uncertainty they are found in the region despite reports of them of the coast of Te Waipounamu / South Island with this uncertainty due to difficulty of field identification; for the black petrel / tāiko, *Procellaria parkinsoni*, there was uncertainty they are found in the region because they are hard to distinguish from the similar-looking Westland petrel / tāiko, *Procellaria westlandica*, and a recent sighting off Taiaroa Head / Pukekura was regarded as 'probable' by the Birds New Zealand Records Appraisal Committee; for Tasmanian albatross / toroa, *Thalassarche cauta cauta*, there was uncertainty they are found in the region because they are hard to distinguish from the New Zealand white-capped / toroa, *Thalassarche cauta stedi*.

Regionally Threatened bird taxa

In the Otago region there were 32 Regionally Threatened bird taxa (Tables 1.3.1, 1.3.2, 1.3.3). These include nine bird taxa that were Regionally Critical, six Regionally Endangered, and 17 Regionally Vulnerable. Of the nine Regionally Critical bird taxa, seven were in the Threatened category in the national threat assessment, where they had the statuses Nationally Critical for one species, Nationally Endangered for three species, Nationally

Regional conservation status of birds in Otago

Vulnerable for two species, and Nationally Increasing for one species (1.3.1). The remaining two Regionally Critical bird taxa were in the At Risk category nationally, each with one species in the statuses Declining and Relict. Of the Regionally Endangered taxa, all were closer to extirpation regionally than they are nationally to extinction: one was considered nationally as Threatened and three At Risk. For Regionally Vulnerable bird taxa, there were 19 identified (Table 1.3.2). Of these bird taxa, four were in the Threatened category in the national assessment (Table 1.3.3). Four taxa were in the equivalent regional- and national-status, with one taxon differing. The taxon which differed between the national assessment and regional assessment is the regionally endemic Otago shag / matapo, because more up-to-date information was available compared to when the national assessment was conducted (Parker & Rexer-Huber 2022); instead of an increasing population of > 10 % the taxon was assessed as stable \pm 10 %.

Regionally At Risk bird taxa

In the Otago region four bird taxa were assigned a Regionally At Risk category (Table 1.4). One taxon was Regionally Recovering while three taxa were Regionally Declining. In contrast to declines in the red-billed gull / tarāpunga, *Larus novaehollandiae scopulinus*, populations nationally, since the early 1990s the regional population has increased with mammalian predator control on the Otago Peninsula / Muaūpoko. The Regionally Declining species have a population decline of 10–30 % in Otago for South Island fernbird / mātātā, *Bowdleria punctata punctata*, brown creeper / pipipi, *Mohoua novaeseelandiae*, and silvereye / tauhou, *Zosterops lateralis lateralis*. Although the brown creeper / pipipi over most of its Otago range is likely experiencing a decline in numbers, the taxon has a secure population in Orokonui Ecosanctuary – Te Korowai o Mihiwaka (hereafter, Orokonui Ecosanctuary). In other words, this taxon meets the Partial Decline qualifier as its declining over most of its range, but with a secure population in the sanctuary. The NZ Garden Bird Survey (MacLeod et al. 2022) showed for silvereyes / tauhou in Otago from 2013 to 2023 a shallow decline, although this decline was moderate from 2018 to 2023.

Regionally Non-resident Native bird taxa

The Otago region had 135 Regionally Non-resident bird taxa (Tables 1.5.1, 1.5.2, 1.5.3). Of these bird taxa, 36 are Regional Migrants, 97 are Regional Vagrants, and two are Regional Colonisers. The number of Regional Migrant bird taxa considered nationally to be Threatened was eight (Nationally Critical: 4; Nationally Vulnerable: 4), nationally At Risk was 16 (Declining: 4; Recovering: 2; Relict: 8; Naturally Uncommon: 3), and nationally Not Threatened was four (Table 1.5.1). For the remainder of the Regional Migrants, they are Non-resident Natives in the national assessment; one taxon had the status Coloniser and the remaining six were Migrants. The Regional Migrants were all seabirds except for the white heron / kōtuku.

Regional conservation status of birds in Otago

Of the Regional Vagrants, seven are considered nationally as Threatened (Nationally Critical: 2; Nationally Endangered: 1; Nationally Vulnerable: 3; Nationally Increasing: 1), 10 are At Risk (Declining: 1; Naturally Uncommon: 6; Relict: 2), one was Not Threatened, and one was Introduced and Naturalised (Table 1.5.2). The remainder of the Regional Vagrants are Non-resident Natives in the national assessment (Coloniser: 4; Migrant: 18; Vagrants: 56) and an Introduced and Naturalised (1; sightings of single birds in Otago are regarded as vagrants).

Two bird taxa were assessed as Regional Colonisers: the royal spoonbill / kōtuku ngutupapa, *Platalea regia*, and Australian coot, *Fulica atra australis* (Table 1.5.3). Royal spoonbill / kōtuku ngutupapa were first reported in Aotearoa New Zealand at Castlepoint / Rangiwahakaoma, Wairarapa, in 1861 (Buller 1869), with breeding confirmed at Waitangiroto in 1949 (Oliver 1955). Breeding has subsequently been reported from other part of the country, including Otago; for example, at Maukiekie Island, Moeraki, 1983–84 (P. Schweigman in Marchant & Higgins 1990); Green Island, Ōtepoti Dunedin, 1988 (P. Schweigman in Marchant & Higgins 1990); Nugget Point / Tokatā, 1995; Taieri Island / Moturata, 1997; Heywood Point, Otago, 2003 (Schweigman 2006); Taiaroa Head / Pukekura, 2004; and the Catlins, 2004 (Schweigman 2006). The Australian coot self-introduced in the 20th century, and was first recorded breeding on Lake Hayes / Waiwhakaata, Otago, in 1958. Given the number of royal spoonbill / kōtuku ngutupapa and Australian coot in Otago still trigger 'Threatened' categories because of their population sizes but arrived in the region without help from humans and have successfully reproduced in the wild since 1950, they were assigned the Regional Coloniser status.

Regional Non-Threatened bird taxa

The number of Regionally Not Threatened bird taxa in Otago was 22 (Table 1.6). Of the Regionally Not Threatened taxa only the New Zealand pipit / pīhoihoi, *Anthus novaeseelandiae novaeseelandiae*, had a threat status with a reduced risk of extinction regionally compared to nationally, i.e., Regionally Not Threatened cf. to At Risk Declining. This is because in Otago there is no evidence of decline for New Zealand pipit / pīhoihoi populations, with the species still well-distributed in suitable habitat types in the region that are not as impacted as elsewhere in the country.

Regional Conservation Translocations of bird taxa

For bird taxa in Otago, conservation translocations – the intentional movement and release of organisms to restore populations – have been used to establish populations (IUCN/SCC 2013; Table 1.7). Types of conservation translocations already used have included reintroduction, the re-establishment of focal taxon within their indigenous range, including for taxa which have gone locally extinct in parts of the region, such as the South Island kākā and South Island robin / kakaruai released at Orokonui Ecosanctuary in 2008 and 2010, respectively. South Island kākā have established a breeding population with fledglings seen

Regional conservation status of birds in Otago

at feeders inside the reserve each autumn, with some individuals observed dispersing long distances from the sanctuary; there are concerns that birds spending time outside the fence also face threats such as introduced predators and inappropriate feeding. Eggs have also failed to hatch for unknown reasons (Otago Natural History Trust 2019). Since their reintroduction, South Island robins / kakaruai have established throughout the sanctuary. The population was estimated to number 80–90 pairs in 2018 (L. Easton pers. comm. in Otago Natural History Trust 2019). South Island robins / kakaruai are now seen outside the reserve, e.g., an individual was seen at Ross Creek in Ōtepoti Dunedin having possibly dispersed from the sanctuary, and at least one population has established in the vicinity of the reserve (Otago Natural History Trust 2019).

For reintroductions where taxon went extinct in the region, this has also occurred: for example, buff weka / weka translocations started in the 2000s and South Island takahē more recently. Buff weka / weka were formerly widespread in eastern low-rainfall areas from Marlborough / Te Taihū-o-te-Waka to Southland / Murihiku in the Te Waipounamu / South Island. The taxon apparently died out on the mainland but remains abundant on Chatham Islands / Rēkohu / Wharekauri and Pitt Island / Rangihau / Rangiauria where they were introduced in 1905. Introduced to islands in Lakes Wānaka and Wakatipu / Whakatipu Waimāori 2005–08 (Miskelly & Powlesland 2013). This includes to Harwich Island (Mou Waho), Lake Wānaka (2005); Pigeon Island (Wāwāhi Waka), Lake Wakatipu / Whakatipu Waimāori (2005–06, 2008); Pig Island (Matau), Lake Wakatipu / Whakatipu Waimāori (2006–08). Failed translocations in Otago include to Stevensons Peninsula, Lake Wānaka (2009) and possibly Motatapu Station, Lake Wānaka (2011–12) (Watts et al. 2017).

South Island takahē were once widespread throughout Te Waipounamu / South Island but following the arrival of humans, the associated introduction of other mammalian predators, and habitat loss, resulted by the 1940s in only remnant population in the mountains of Te Rua-o-Te-Moko / Fiordland. The modern conservation programme has set up additional populations, and advocacy sites. In August 2023, 18 takahē (nine pairs) were released into the Greenstone Valley, near Glenorchy at the head of Lake Wakaitpu – Whakatipu Waimāori. A further six juveniles were released in November 2023, with further reinforcement occurring. Two pairs of South Island takahē are currently at Orokonui Ecosanctuary (E. Smith, pers. comm., 2023, Orokonui Ecosanctuary, Conservation Manager). While takahē are free roaming at Orokonui Ecosanctuary, with one pair in the upper sanctuary separated by a low fence from the other pair in the lower sanctuary due to their being defensive about territories, a self-sustaining population is not possible. The sanctuary is an important advocacy site for takahē while also serving as a crèche, with patches of takahē habitat for at least two pairs of birds to live (Hunter-Ayad et al., 2021; Otago Natural History Trust, 2019).

Another type of conservation translocation is assisted migration, or managed relocation, the movement of the focal taxa outside its indigenous range to avoid extinctions (Seddon et al.

Regional conservation status of birds in Otago

2014). In Otago Haast tokoeka / tokoeka were released at Orokonui Ecosanctuary in 2010 (Otago Natural History Trust 2019). Since being translocated to Orokonui Ecosanctuary the threat status of Haast tokoeka / tokoeka has improved in the national assessment from Nationally Critical to Nationally Vulnerable due to the extensive trapping of predators and use of aerial 1080 poison operations over the core 6000-ha area of South Westland occupied by the taxon. Additionally, the discovery of a small satellite population of ca. 12 pairs 15 km west of the previously known range, and ex situ management through Operation Nest Egg (ONE) and the establishment of small populations on Coal / Te Puka-Hereka, Pomona, and Rarotoka islands and at Orokonui Ecosanctuary, resulted in the population growing to ca. 450 mature individuals by 2018 (Germano et al. 2018).

Future conservation translocations of candidate taxa discussed in restoration plans for the mainland sanctuary at Orokonui Ecosanctuary include one of the three species of kakariki (yellow-crowned, red-crowned, orange-fronted), South Island saddleback / tieke, Snares Island snipe / tutukiwi, mohua / yellowhead, mottled petrel / kōrure, and sooty shearwater / tītī (Otago Natural History Trust 2019). South Island saddleback / tieke were reintroduced in 2009 (Masuda et al. 2010; Masuda & Jamieson 2012) and reinforced in 2013 (Otago Natural History Trust 2019). An unknown number of these birds migrated out of the reserve, but a small breeding population had established by 2015, suggesting suitable habitat exists to support this taxon. In that year, however, South Island saddleback / tieke were extirpated in the sanctuary, most likely because of one or more incursions by stoats (E Smith pers. comm. in Otago Natural History Trust 2019). Subsequent consultation with Kāti Huirapa ki Puketeraki, i.e., mana whenua at Orokonui Ecosanctuary, has indicated that they would support further translocations of this species into the reserve, and surplus birds are available from source islands (E Smith pers. comm. 2024, Orokonui Ecosanctuary).

Regionally Introduced and Naturalised bird taxa

In Otago, 25 bird taxa were identified as Regionally Introduced and Naturalised (Table 1.8). These are taxa that have become naturalised in the wild after being deliberately or accidentally introduced in Aotearoa New Zealand by human agency. All of these taxa in Otago have populations secure overseas. While most of these bird taxa have large populations in Otago, some are considerably smaller in size, although often there is low confidence on the size of the populations.

Regionally Introduced, not Established bird taxa

The Regionally Introduced, not Established bird taxa category is analogous to that found in New Zealand Birds online website but for Otago only (Table 1.9). This category includes bird taxa sighted where: 1) a release is documented, but with non-sustaining population not yet establishing in the wild or where a deliberate introduction is documented; and 2) published records indicate the species bred (or probably bred), but it is no longer extant. Of the 10 bird

Regional conservation status of birds in Otago

taxa identified, seven are listed in the national assessment: six Introduced and Naturalised taxa, one Not Assessed, and three are not included. The six taxa in the national assessment identified as Introduced and Naturalised were suspected to most likely be escapees from captivity or released animals. The Not Assessed taxon was the feral chicken. Although assessed as Introduced and Naturalised in earlier versions of the national assessment, it was removed from the 2021 national assessment (Robertson et al. 2021). While known to breed in the wild in Aotearoa New Zealand, no viable wild populations have established, and most enclaves are supplemented by ongoing releases and/or supplementary feeding (Heather & Robertson 2015). The three taxa (cockatiel, golden pheasant, muscovy duck) not included in the national assessment but reported here are postulated to live in semi-wild states bolstered by birds that escape from captivity or are released. The locations where Regionally Introduced, not Established bird taxa have been documented by Territorial Authority, Coastal Marine Area, and Freshwater Management Unit or rohe are noted in Appendices 9 and 10.

Regionally Not Assessed bird taxa

In Otago two bird taxa were not assessed by the national assessment (Robertson et al. 2021), including crimson rosella, *Platycercus elegans*, and the Magellanic penguin, *Spheniscus magellanicus*. While the crimson rosella was assessed as Introduced and Naturalised in earlier versions of the national assessment, a breeding population of this species in Ōtepoti Dunedin died out in the 1950s (Heather & Robertson 2015). The national panel assessed that the species is no longer naturalised in Aotearoa New Zealand and so removed it from the 2021 list (Robertson et al. 2021). The magellanic penguin was excluded from the latest national assessment, because its occurrence in Aotearoa New Zealand is regarded as a failed introduction rather than as a vagrant (Gill et al. 2010).

Select Regional Qualifiers discussion

Qualifiers can be an integral part of threat assessments by helping to define a taxon's assessment, status, and management. Below are explanations of why some regional qualifiers were used for bird taxa in Otago.

Regional Endemics and National Strongholds

The Otago region had eight species assigned the qualifier National Stronghold (Appendix 7). These species have > 20% of the national population in Otago. The only regional endemic, i.e., known to exclusively breed in the region, is the Otago shag / matapo. Of the taxa that have National Strongholds in Otago, seven were Regionally Threatened (Regionally Critical = 1; Regionally Vulnerable = 6), and one was Regionally At Risk (Regionally Recovering).

Type Locality

In Otago, the number of taxa with type localities was 13 (Appendix 8). The type locality of a nominal taxon refers to the geographical (and, where relevant, stratigraphical) place of

Regional conservation status of birds in Otago

capture, collection, or observation on the name-bearing type or specimen. There were four extant taxa with type localities in Otago: Australasian crested grebe / pūteketeke, fairy prion / tītī wainui, Fiordland crested penguin / tawaki, and Otago shag / matapo. Nine globally extinct species have their type locality in the region.

Increasing

While most resident indigenous bird taxa were declining (< 10%; 20 taxa) or stable (\pm 10%; 34 taxa) in total population in Otago, four taxa had the qualifier Increasing, i.e., there is an ongoing or forecast increase of > 10% in the total population, taken over the next 10 years or three generations, whichever is longer: Haast tokoeka, Australian coot, northern royal albatross / toroa, and Australasian crested grebe / pūteketeke. The red-billed gull / tarāpunga also has > 10 % ongoing or forecast increase in total population, but this qualifier is redundant for taxa ranked as 'Recovering'.

Haast tokoeka / tokoeka were released at Orokonui Ecosanctuary in 2010. The number of individuals in the lower sanctuary has increased to approximately 35 birds (Smith, pers comm. 2024). However, the carrying capacity for Haast tokoeka / tokoeka at Orokonui Ecosanctuary is limited due to the size of sanctuary, so growth is unlikely to continue for much longer. For Australian coot, a subspecies of the Eurasian coot that self-introduced into Aotearoa New Zealand from Australia in the 20th century, was first recorded breeding in Aotearoa New Zealand on Lake Hayes / Waiwhakaata, Otago in 1958. While the first northern royal albatross / toroa chick fledged at Taiaroa Head / Pukekura in 1938, the number of mature individuals was 242 as of October 2023. Australasian crested grebe / pūteketeke are currently increasing in Aotearoa New Zealand after reaching a low of about 200 birds in the 1980s. In Otago counts of adults rose from a total of 96 in the 2004 census to 173 in 2021, and 384 adults were counted in 2024.

Climate Impact

Of the resident native bird taxa 25 were assigned the Climate Impact qualifier. This qualifier can be applied when the taxon is, or is predicted, to be adversely affected by long-term climate trends and/or extreme climatic events. All the birds in Otago who were assigned this qualifier were in the Regionally Threatened or Regionally At Risk categories, except for the New Zealand pipit / pihoihoi and Australian little penguin / kororā. Using the AVONET dataset for all birds that includes morphological, geographical and ecological data (Tobias et al. 2022), the main habitat for those birds with the Climate Impact qualifier was coastal or marine for 12 taxa, wetland or riverine for seven taxa, and forest, grassland or shrubland for six taxa. Most bird taxa had a trophic niche mainly as aquatic predators (n = 16), with the remainder being a mix of omnivores (n = 5), insectivores (n = 3), and granivores (n = 1). The regional conservation status was Regionally Critical for seven bird taxa, Regionally Endangered for two bird taxa, Regionally Vulnerable for 12 bird taxa, Regionally Recovery for one bird taxon,

Regional conservation status of birds in Otago

Regional Conservation Translocation for one bird taxon, and Regionally Not Threatened for two bird taxa.

A major reason for the those in the aquatic domains to have the Climate Impact qualifier was due to direct or indirect impacts because of coastal squeeze, the loss of habitats urban development compounded by sea-level rise and an increased intensity and frequency of extreme weather events (Keegan et al. 2022). For those bird taxa in the terrestrial domain more complicated indirect processes include the clear evidence for the spread of pest animal species increasing into habitats of vulnerable bird taxa, causing thermal squeeze (Walker et al. 2019).

Conservation Dependent

A Conservation Dependent taxon are those likely to move to a worse conservation status if current management ceases. The term 'management' can include indirect actions that benefit taxa, such as elimination of mammalian predators from ecosanctuaries. Of the 17 bird taxa identified with the Conservation Dependent qualifier in Otago they were either Regionally Threatened or had been a Conservation Translocation to the region, except for the Australian little penguin / kororā. Six taxa with the status Regionally Critical had the Conservation Dependent qualifier. Most of these were because they had a population size less than 250 mature individuals, except for the southern rock wren / pīwauwau and yellow-eyed penguin / hoiho with a population of 250–1000 mature individuals but population trends decreasing by 50–70 % and trend decreasing by 70 %, respectively.

One Location

Two taxa assigned the qualifier One Location for Otago: Haast tokoeka / tokoeka and northern royal albatross / toroa. Haast tokoeka / tokoeka are only found at Orokonui Ecosanctuary, where they were released in 2010. Although the breeding range for northern royal albatross / toroa is primarily the Chatham Islands / Rēkohu / Wharekauri (Forty-Fours Motchuhar / Motuhara, Big and Little Sister Islands / Rakitchu / Rangitatahi), there is a colony at Taiaroa Head / Pukekura on the Otago Peninsula / Muaūpoko.

Range Restricted

The number of bird taxa with the Range Restricted qualifier was six. Although five of the six taxa were Range Restricted in the national assessment, the regional panel also considered the endemic Otago shag / matapo. This is because the Otago shag / matapo typically roost on headlands, small islands, and now man-made structures, totalling less than 100 km². Although the qualifier specifies natural substrates, the man-made structures are small in total area.

 Regional conservation status of birds in Otago

Restored Native

In Otago the two bird taxa to have been regionally extirpated and to be reintroduced with extant populations are buff weka and South Island takahē. Buff weka species were formerly widespread in eastern low-rainfall areas from Marlborough / Te Taihū-o-te-Waka to Southland / Murihiku, but died out on the mainland, only surviving on the Chatham Islands / Rēkohu / Wharekauri and Pitt Island / Rangihau / Rangiauria where it was introduced in 1905. Following reintroduction attempts, buff weka are currently found on four islands in two lakes in Otago, and reintroduced individuals may be remnant in the Motatapu Valley. Although South Island takahē have been translocated to Orokonui Ecosanctuary and the Greenstone Valley, they are not yet self-sustaining populations. Although South Island saddleback / tieke were translocated to Orokonui Ecosanctuary in 2009 and 2013, a population did not establish due to a stoat incursion in 2015, despite initially showing promising signs (Otago Natural History Trust 2019). South Island kākā have also been reintroduced to Orokonui Ecosanctuary, with conspecifics already being within the region.

Introduced Native

The only bird taxon with the Introduced Native qualifier was the Haast tokoeka. Since 2010 Haast tokoeka / tokoeka have been in Otago at Orokonui Ecosanctuary, where there is now estimated to be between 35 mature individuals in the lower sanctuary. Although there are additional Haast tokoeka / tokoeka in the upper sanctuary these birds are part of a creche where they are reared until they are large enough to be released in the wild. Although Haast tokoeka / tokoeka were unlikely to have been the kiwi subspecies in the eastern Te Waipounamu / South Island, there was likely a tokoeka taxon found nearby.

Former Resident

At least three bird taxa formerly had breeding populations (existing for more than 50 years) in Otago but were extirpated from the region yet continue to arrive as a regional vagrant or migrant: black stilt / kakī and southern New Zealand dotterel / pukunui. The black stilt / kakī was once widespread in Aotearoa New Zealand, but the range contracted to Waitaha / Canterbury and Otago in the 1950s, South Canterbury-North Otago by the 1970s, and the Mackenzie Basin / Te Manahuna by the 1980s. Outside the breeding season most black stilt / kakī move locally within the Mackenzie Basin / Te Manahuna, but < 10 individuals visit the Otago region each year, making them currently a Regional Vagrant. The southern New Zealand dotterel / tūturiwhatu was formerly widespread on Te Waipounamu / South Island but was extirpated by about 1900. The breeding range is now confined to Rakiura / Stewart Island, but occasionally birds are seen in Otago, so they are a Regional Vagrant. Although Fiordland crested penguin / tawaki breed in South Westland, many sites in Te Rua-o-Te-Moko / Fiordland, Hautere / Solander Island, Whenua Hou / Codfish Island and Rakiura / Stewart Island and outliers, historic accounts and fossil records suggest breeding was more

Regional conservation status of birds in Otago

widespread in the past, including in Otago. More than 15 Fiordland crested penguin / tawaki are resumed to visit the Otago region each year, making the taxon a Regional Migrant.

Presence of Bird Taxa in Territorial Authorities, Coastal Marine Area, and Freshwater Management Units or rohe

Numerous bird taxa are present in every Territorial Authorities, Coastal Marine Area, and Freshwater Management Unit or rohe in the Otago Region for the categories of Regionally Threatened, Regionally At Risk, Regionally Non-resident (Migrant and Coloniser only), Regionally Introduced and Naturalised, and Regionally Conservation Translocated bird (Tables 2 and 3). In these categories 123 bird taxa were recorded as present in Territorial Authorities or the Coastal Marine Area, with 98 on them being native (Table 2). The most speciose territorial authority is Dunedin City Council with 86, followed by Clutha District Council with 80, Waitaki District Council (Otago part only) with 77 taxa, followed by Queenstown Lakes District Council with 73, and Central Otago District Council with 63 taxa. The Region had 70 bird taxa (68 native, 2 Introduced and Naturalised) recorded from its Coastal Marine area, particularly highlighting the importance of Otago's coastal and marine space to indigenous biodiversity in Aotearoa New Zealand. All Regional Migrants in Otago were recorded from in or near to the Coastal Marine Area (Table 2). The Regional Migrants were all seabirds except for the white heron / kōtuku.

Of the above categories the number of bird taxa recorded in Otago Regional Council's Freshwater Management Units (FMU) or rohe range 95, with 68 of these being native (Table 3). The most speciose FMU or rohe is the Dunedin & Coast FMU with 83 taxa, followed by Catlins FMU with 79 taxa, North Otago with 78 taxa, Taiari FMU with 74 taxa, Lower Clutha Rohe with 73 taxa, Upper Lakes Rohe with 72, Dunstan Rohe with 62 taxa, and both Manuherekia Rohe and Roxburgh Rohe with 56.

Summary

In this report, and for the first time, the number of bird species recorded in the Otago Region since human arrival were identified and collated systematically. A panel of experts then applied a consistent framework to assign the conservation status, trends and qualifiers to these taxa. These findings highlighted in Otago a high number of Regionally Threatened, Regionally At Risk, Regionally Data Deficient, and Regionally Non-resident Natives.

Although DOC is tasked with managing indigenous taxa nationally, regional and district councils have a statutory obligation to maintain indigenous biodiversity under the RMA, including to protect habitats of Threatened taxa. An understanding of regional population sizes of bird taxa and their distributions should help to inform management. For example, this could include by informing Assessments of Environmental Effects through RMA consenting processes; and the prioritisation of conservation or restoration activities by regional council and territorial authorities, such as by pest animal and plant control, or monitoring to assess

Regional conservation status of birds in Otago

effectiveness of management interventions. The benefits to be gained from assessing the threat to indigenous taxa at a regional scale, which are complementary to national assessments, include:

- improved knowledge of the status of taxa across the region,
- direction for local government and community groups to prioritise conservation actions that can work in synergy with or provide additionality to the work of DOC,
- an improved ability to protect taxa through regulatory processes, and
- improved national conservation assessments of species through greater local input.

Process 1: Determination of regional threat status

Process 2: Determination of strongholds and Regionally Not Threatened species

Regional conservation status of birds in Otago

Appendix 2: List of Regional Qualifiers for Regional Conservation Threat Assessments

Code	Qualifier	Description
FR	Former Resident	Breeding population (existed for more than 50 years) extirpated from region but continues to arrive as a regional vagrant or migrant. FR and RN are mutually exclusive.
HR	Historical Range	The inferred range (extending in any direction) of the taxon in pre-human times meets its natural limit in the region.
IN	Introduced Native	Introduced to the region, though not known to have previously occurred in it.
NStr	National Stronghold	More than 20% of the national population breeding or resident for more than half their life cycle in the region.
NR	Natural Range	The known range (extending in any direction) of the taxon meets its natural limit in the region.
RE	Regional Endemic	Known to breed only in the region.
RN	Restored Native	Reintroduced to the region after having previously gone extinct there.
TL	Type Locality	The type locality of the taxon is within the region. Ignore if the taxon is or has ever been regionally extinct

Regional conservation status of birds in Otago

Appendix 3: List of National Qualifiers from the New Zealand Threat Classification System (Townsend et al. 2008; Michel 2021; Rolfe et al. 2021)

Code	Qualifier	Qualifier Type	Description
DPR	Data Poor: Recognition	Assessment Process Qualifier	Confidence in the assessment is low because of difficulties determining the identity of taxon in the field and/or in the laboratory. Taxa that are DPR will often be DPS and DPT. In such cases, the taxon is most likely to be Data Deficient.
DPS	Data Poor: Size	Assessment Process Qualifier	Confidence in the assessment is low because of a lack of data on population size.
DPT	Data Poor: Trend	Assessment Process Qualifier	Confidence in the assessment is low because of a lack of data on population trend.
DE	Designated	Assessment Process Qualifier	A taxon that the Expert Panel has assigned to what they consider to be the most appropriate status without full application of the criteria. For example, a commercial fish that is being fished down to Biomass Maximum Sustainable yield (BMSy) may meet criteria for 'Declining', however, it could be designated as 'Not Threatened' if the Expert Panel believes that this better describes the taxon's risk of extinction.
IE	Island Endemic	Biological Attribute Qualifier	A taxon whose naturally distribution is restricted to one island archipelago (e.g., Auckland Island / Mauka Huka) and is not part of the Te Ika-a-Māui / North Island or Te Waipounamu / South Island or Stewart Island / Rakiura. This qualifier is equivalent to the 'Natural' Population State value in the database.
NS	Natural State	Biological Attribute Qualifier	A taxon that has a stable or increasing population that is presumed to be in a natural condition, i.e., has not experienced historical human-induced decline.
RR	Range Restricted	Biological Attribute Qualifier	A taxon naturally confined to specific substrates, habitats or geographic areas of less than 100 km ² (100,000 ha), this is assessed by taking into account the area of occupied habitat of all sub-populations (and summing the areas of habitat if there is more than one sub-population), e.g., Chatham Island forget-me-not (<i>Myosotidium hortensia</i>) and Auckland Island snipe (<i>Coenocorypha aucklandica aucklandica</i>). This qualifier can apply to any 'Threatened' or 'At Risk' taxon. It is redundant if a taxon is confined to 'One Location' (OL)
Sp	Biologically Sparse	Biological Attribute Qualifier	The taxon naturally occurs within typically small and widely scattered subpopulations. This qualifier can apply to any 'Threatened' or 'At Risk' taxon.

Regional conservation status of birds in Otago

List of National Qualifiers from the New Zealand Threat Classification System

Code	Qualifier	Qualifier Type	Description
NO	Naturalized Overseas	Population State Qualifier	An Aotearoa New Zealand endemic taxon that has been introduced by human agency to another country (deliberately or accidentally) and has naturalised there, e.g., <i>Olearia traversiourum</i> in the Republic of Ireland.
OL	One Location	Population State Qualifier	Found at one location in Aotearoa New Zealand (geographically or ecologically distinct area) of less than 100,000 ha (1000 km ²), in which a single event (e.g., a predator irruption) could easily affect all individuals of the taxon, e.g., L'Esperance Rock groundsel (<i>Senecio esperensis</i>) and Open Bay leech (<i>Hirudobdella antipodum</i>). 'OL' can apply to all 'Threatened', 'At Risk', 'Non-resident Native' – Coloniser and Non-resident Native – Migrant taxa, regardless of whether their restricted distribution in Aotearoa New Zealand is natural or human-induced. Resident native taxa with restricted distributions but where it is unlikely that all sub-populations would be threatened by a single event (e.g., because water channels within an archipelago are larger than known terrestrial predator swimming distances) should be qualified as 'Range Restricted' (RR).
SO	Secure Overseas	Population State Qualifier	The taxon is secure in the parts of its natural range outside Aotearoa New Zealand.
SO?	Secure Overseas?	Population State Qualifier	It is uncertain whether a taxon of the same that is secure in the parts of its natural range outside Aotearoa New Zealand is conspecific with the Aotearoa New Zealand taxon.
S?O	Secure? Overseas	Population State Qualifier	It is uncertain whether the taxon is secure in the parts of its natural range outside Aotearoa New Zealand.
TO	Threatened Overseas	Population State Qualifier	The taxon is threatened in the parts of its natural range outside Aotearoa New Zealand.
TO?	Threatened Overseas?	Population State Qualifier	It is uncertain whether a taxon of the same name that is threatened in the parts of its natural range outside New Zealand is conspecific with the New Zealand taxon.
T?O	Threatened? Overseas	Population State Qualifier	It is uncertain whether the taxon is threatened in the parts of its natural range outside Aotearoa New Zealand.

Regional conservation status of birds in Otago

List of National Qualifiers from the New Zealand Threat Classification System

Code	Qualifier	Qualifier Type	Description
CI	Climate Impact	Pressure Management Qualifier	<p>The taxon is adversely affected by long-term climate trends and/or extreme climatic events.</p> <p>The following questions provide a guide to using the CI Qualifier: Is the taxon adversely affected by long-term changes in the climate, such as an increase in average temperature or sea-level rise? If NO = no Qualifier but needs monitoring and periodic re-evaluation because projected changes to the average climate and sea-level rise may adversely impact the taxon (including via changes to the distribution and prevalence of pests, weeds and predators) in the future. If YES = CI Qualifier Is the taxon adversely affected by extreme climate events, such as a drought, storm or heatwave? If No = no Qualifier but needs monitoring and periodic re-evaluation because projected changes to the climate are likely to increase the frequency and/or severity of these events in the future. If YES = CI Qualifier</p> <p>Use of the Climate Impact Qualifier would indicate the need for more in-depth research, ongoing monitoring of climate impacts, and potentially a climate change adaptation plan for the taxon</p>
CD	Conservation Dependent	Pressure Management Qualifier	<p>The taxon is likely to move to a worse conservation status if current management ceases. The term 'management' can include indirect actions that benefit taxa, such as island biosecurity.</p> <p>Management can make a taxon CD only if cessation of the management would result in a worse conservation status. The influence of the benefits of management on the total population must be considered before using CD. The benefit of managing a single subpopulation may not be adequate to trigger CD, but may trigger Partial Decline (PD).</p> <p>Taxa qualified CD may also be PD because of the benefits of management.</p>
CR	Conservation Research Needed	Pressure Management Qualifier	<p>Causes of decline and/or solutions for recovery are poorly understood and research is required.</p>

Regional conservation status of birds in Otago

List of National Qualifiers from the New Zealand Threat Classification System

Code	Qualifier	Qualifier Type	Description
EW	Extinct In The Wild	Pressure Management Qualifier	The taxon is known only in captivity or cultivation or has been reintroduced to the wild but is not self-sustaining. Assessment of a reintroduced population should be considered only when it is self-sustaining. A population is deemed to be self-sustaining when the following two criteria have been fulfilled: it is expanding or has reached a stable state through natural replenishment and at least half the breeding adults are products of the natural replenishment, and it has been at least 10 years since reintroduction
EF	Extreme Fluctuations	Pressure Management Qualifier	The taxon experiences extreme unnatural population fluctuations, or natural fluctuations overlaying human-induced declines, that increase the threat of extinction. When ranking taxa with extreme fluctuations, the lowest estimate of mature individuals should be used for determining population size, as a precautionary measure.
INC	Increasing	Pressure Management Qualifier	There is an ongoing or forecast increase of > 10% in the total population, taken over the next 10 years or three generations, whichever is longer. This qualifier is redundant for taxa ranked as 'Recovering'.
PD	Partial Decline	Pressure Management Qualifier	The taxon is declining over most of its range, but with one or more secure populations (such as on offshore islands). Partial decline taxa (e.g., North Island kākā <i>Nestor meridionalis septentrionalis</i> and Pacific gecko <i>Dactylocnemis pacificus</i>) are declining towards a small stable population, for which the Relict qualifier may be appropriate.
PF	Population Fragmentation	Pressure Management Qualifier	Gene flow between subpopulations is hampered as a direct or indirect result of human activity. Naturally disjunct populations are not considered to be 'fragmented'.
PE	Possibly/Presumed Extinct	Pressure Management Qualifier	A taxon that has not been observed for more than 50 years but for which there is little or no evidence to support declaring it extinct. This qualifier might apply to several Data Deficient and Nationally Critical taxa.
RF	Recruitment Failure	Pressure Management Qualifier	The age structure of the current population is such that a catastrophic decline is likely in the future. Failure to produce new progeny or failure of progeny to reach maturity can be masked by apparently healthy populations of mature specimens.

Regional conservation status of birds in Otago

List of National Qualifiers from the New Zealand Threat Classification System

Code	Qualifier	Qualifier Type	Description
Rel	Relict	Pressure Management Qualifier	<p>The taxon has declined since human arrival to less than 10% of its former range but its population has stabilised.</p> <p>The range of a relictual taxon takes into account the area currently occupied as a ratio of its former extent. Reintroduced and self-sustaining populations within or outside the former known range of a taxon should be considered when determining whether a taxon is relictual.</p> <p>This definition is modified from the definition of the At Risk – Relict category in the NZTCS manual (Townsend et al. 2008). The main difference is that trend is not included in the qualifier definition. This enables the qualifier to be applied to any taxon that has experienced severe range contraction, regardless of whether that contraction continues or has been arrested.</p> <p>This qualifier complements the 'Naturally Uncommon (NU)' qualifier which can be applied to taxa whose abundance has declined but which continue to occupy a substantial part of their natural range.</p>

Regional conservation status of birds in Otago

Appendix 4: Name differences affecting bird taxa found in the Otago region between this report which follows Robertson et al. (2021) and the publication of the Checklist of the Birds of New Zealand (Checklist Committee, 2022). The Notes column includes information on geographical variation and/or distribution information.

Name and Authority in this Report	Common Name and Māori Name from the National Assessment	Name and Authority in Committee Checklist	Common Name in Committee Checklist	Notes
<i>Anas chlorotis</i> "South Island" G.R. Gray, 1845	South Island brown teal / pāteke*	<i>Anas chlorotis</i> G.R. Gray, 1845	brown teal / pāteke	Geographical variation in Committee Checklist: Nil. Originally widely distributed in lowland swamps and swamp forests of both main islands and Rakiura / Stewart Island, where it was the most common duck species in pre-human deposits (Worthy 2002a, 2004); now rare and localised.
<i>Anas clypeata</i> Linnaeus, 1758	northern shoveler	<i>Spatula clypeata</i> (Linnaeus, 1758)	northern shoveler	Geographical variation in Committee Checklist: Nil.
<i>Anas platyrhynchos</i> Linnaeus, 1758	mallard duck / rakiraki	<i>Anas platyrhynchos platyrhynchos</i> Linnaeus, 1758	mallard	Geographical variation in the Checklist Committee: None now recognised. However, formerly thought could be seven subspecies, although some uncertainty. Introduced to Aotearoa New Zealand from the United Kingdom (1865–1920s) and North America (1937) and reared extensively for release until the 1960s. Now a widespread waterfowl in Aotearoa New Zealand.
<i>Anas rhynchos</i> (Latham, 1802)	Australasian shoveler / kuruwheangi	<i>Spatula rhynchos</i> (Latham, 1802)	Australasian shoveler	Geographical variation in the Checklist Committee: None now recognised but formerly considered a separate subspecies (<i>A. r. variegata</i>) from that in Australia (<i>A. r. rhynchos</i>).

<i>Ardea modesta</i> J.E. Gray, 1831	white heron / kōtuku	<i>Ardea alba modesta</i> J.E. Gray, 1831	white heron	Geographical variation in the Checklist Committee: Four subspecies are globally recognised, with the eastern great egret (<i>Ardea modesta</i> = <i>A. a. modesta</i>) occurring from eastern Asia to Australasia, including a small population in Aotearoa New Zealand. Sometimes considered a full species. Notes: Its sole Aotearoa New Zealand breeding site near Ōkarito Lagoon in Westland is well-known and well-protected, but elsewhere it is 'He kōtuku rerenga tahi' or the bird of single flight, implying something seen perhaps once in a lifetime.
<i>Ardea ibis coromanda</i> Boddaert, 1783	eastern cattle egret	<i>Bubulcus ibis coromandus</i> (Boddaert, 1783)	eastern cattle egret	Geographical variation in the Checklist Committee: Three subspecies recognised, with the eastern cattle egret <i>Bubulcus ibis coromandus</i> throughout south-east Asia and south to Australia and Aotearoa New Zealand.
<i>Arenaria interpres</i> (Linnaeus, 1758)	ruddy turnstone	<i>Arenaria interpres interpres</i> (Linnaeus, 1758)	ruddy turnstone	Geographical variation in the Checklist Committee: Two subspecies; Aotearoa New Zealand birds are <i>A. i. interpres</i> .
<i>Ardea intermedia plumifera</i> Wagler, 1829	plumed intermediate egret	<i>Ardea intermedia plumifera</i> Wagler, 1829	plumed egret	Geographical variation in the Checklist Committee: There are 3 subspecies of <i>Ardea intermedia</i> ; Aotearoa New Zealand birds are likely to be <i>A. i. plumifera</i> .
<i>Ardea pacifica</i> Latham, 1802	white-necked heron	<i>Ardea pacifica</i> Latham, 1802	Pacific heron	Geographical variation in Committee Checklist: Nil.
<i>Bowdleria punctata punctata</i> Quoy & Gaimard, 1830	South Island fernbird / mātātā	<i>Poodytes punctatus punctatus</i> (Quoy & Gaimard, 1830)	South Island fernbird	Geographical variation in Checklist Committee: Five subspecies, all extant. In Otago, South Island fernbird / mātātā <i>P. p. punctatus</i> .

Name and Authority in this Report	Common Name in this Report	Name and Authority in Committee Checklist	Common Name in Committee Checklist	Notes
<i>Branta canadensis</i> Linnaeus, 1758	Canada goose / kuihi	<i>Branta canadensis</i> <i>maxima</i> Linnaeus, 1758	Canada goose	Geographical variation in Checklist Committee: A native North American goose with an extensive history of population and substructure and with each grouping distinguishable by size and phenotype. The Aotearoa New Zealand population is primarily descended from an importation of 50 birds in 1905. The size and plumage characteristics matched those of the largest race recognised, <i>B. canadensis maxima</i> .
<i>Calidris canutus rogersi</i> Mathews, 1913	lesser knot / huahou*	<i>Calidris canutus rogersi</i> Mathews, 1913	red knot	Geographical variation in Checklist Committee: Six subspecies globally; two reach Aotearoa New Zealand (<i>rogersi</i> , breeding in Chukotka, eastern Russia, and <i>piersmai</i> , breeding on the New Siberian Islands).
<i>Callipepla californica</i> Shaw, 1798	California quail / tikaokao	<i>Callipepla californica</i> <i>brunnescens</i> Ridgeway 1884	California quail	Introduced to Aotearoa New Zealand from 1865 to 1875 in both Te Ika-a-Māui / North Island and Te Waipounamu / South Island with subsequent liberations of Aotearoa New Zealand-bred stock. Now widely distributed.
<i>Carduelis carduelis</i> Linnaeus, 1758	European goldfinch / kōurarini	<i>Carduelis carduelis</i> <i>britannica</i> Hartert, 1903	European goldfinch	Geographical variation in Checklist Committee: Aotearoa New Zealand birds are assigned to the subspecies <i>britannica</i> .
<i>Carduelis chloris</i> (Linnaeus, 1758)	European greenfinch	<i>Chloris chloris</i> (Linnaeus, 1758)	European greenfinch	Geographical variation in Checklist Committee: The subspecies that Aotearoa New Zealand birds belong to is uncertain.
<i>Carduelis flammea</i> (Linnaeus, 1758)	common redpoll	<i>Acanthis</i> <i>flammea</i> (Linnaeus, 1758)	common redpoll	Geographical variation in Checklist Committee: Aotearoa New Zealand birds are assigned to the subspecies <i>cabaret</i> .
<i>Catharacta</i> <i>maccormicki</i> (Saunders, 1893)	Antarctic skua	<i>Stercorarius</i> <i>maccormicki</i> Saunders, 1893	south polar skua	Geographical variation in Checklist Committee: As with the subantarctic skua, taxonomy is disputed by experts, with some designating the genus as <i>Catharacta</i> , others as <i>Stercorarius</i> . A polymorphic skua, with no determined geographical basis to the circumpolar distribution of its three morphs.

Name and Authority in this Report	Common Name in this Report	Name and Authority in Committee Checklist	Common Name in Committee Checklist	Notes
<i>Catharacta antarctica lonnbergi</i> Mathews, 1912	subantarctic skua / hākoakoa	<i>Stercorarius antarctica lonnbergi</i> Mathews, 1912	subantarctic skua	Geographical variation in Checklist Committee: As with the Antarctic skua, taxonomy is disputed by experts, with some designating the genus as <i>Stercorarius</i> , others as <i>Catharacta</i> . Aotearoa New Zealand's subantarctic skuas / hākoakoa are currently referred to in Aotearoa New Zealand as <i>Stercorarius antarcticus lonnbergi</i> .
<i>Circus approximans</i> Peale, 1848	Australasian harrier / kāhu	<i>Circus approximans</i> Peale, 1848	swamp harrier	Geographical variation in Committee Checklist: Nil.
<i>Charadrius mongolus</i> Pallas, 1776	Mongolian dotterel	<i>Charadrius mongolus</i> Pallas, 1776	lesser sand plover	Geographical variation in Committee Checklist: Five races globally recognised, with three 'black-faced' and more westerly breeding (<i>pamierensis</i> , <i>atrifrons</i> , <i>schaferi</i>), and two with white on their foreheads when breeding, that breed in eastern Siberia (<i>mongolus</i> and <i>stegmanni</i>).
<i>Charadrius ruficapillus</i> Temminck, 18	red-capped dotterel	<i>Charadrius ruficapillus</i> Temminck, 1821	red-capped plover	Geographical variation in Committee Checklist: Nil.
<i>Coprotheres pomarinus</i> (Temminck, 1815)	pomarine skua	<i>Stercorarius pomarinus</i> (Temminck, 1815)	pomarine skua	Geographical variation in Committee Checklist: Nil.
<i>Cuculus pallidus</i> (Latham, 1801)	pallid cuckoo	<i>Cacomantis pallidus</i> (Latham, 1802)	pallid cuckoo	Notes: The pallid cuckoo breeds in south-western and south-eastern Australia, migrating north after breeding to northern Australia, Papua New Guinea, Indonesia, Timor-Leste, Moluccas and Lesser Sundas. It is common in Australia, but a vagrant to Aotearoa New Zealand, no breeding records here. The first bird visited the same central Otago farm for Three consecutive years during the non-breeding season (May-October), from 1939 to 1941.

<i>Dacelo novaeguineae</i> Hermann, 1783	laughing kookaburra	<i>Dacelo novaeguineae</i> <i>novaeguineae</i> Hermann, 1783	laughing kookaburra	Geographical variation in Committee Checklist: Aotearoa New Zealand birds are assigned to the subspecies <i>novaeguineae</i> . Notes: Sightings of single birds from elsewhere in Te Ika-a-Māui / North Island (Cape Maria van Diemen, Waikato, Tairāwhiti / Gisborne) and from Te Waipounamu / South Island (Westland, Otago) are regarded as vagrants, either from Northland or Australia. Kookaburras inhabit open wooded country and forest margins.
<i>Egretta novaehollandiae</i> (Latham, 1790)	white-faced heron / matuku moana	<i>Egretta novaehollandiae</i> <i>novaehollandiae</i> (Latham, 1790)	white-faced heron	Geographical variation in Checklist Committee: Two subspecies, with <i>E. n. novaehollandiae</i> found in Aotearoa New Zealand.
<i>Eolophus roseicapillus</i> (Vieillot, 1817)	galah	<i>Eolophus roseicapilla</i> (Vieillot, 1817)	galah	Notes: Galah are localised in distribution, with the only wild population spread widely over the South Tāmaki Makaurau / Auckland area, including a breeding population on Ponui Island in the Hauraki Gulf. Present in Aotearoa New Zealand as a cage-bird. Presumed escapees recorded elsewhere.
<i>Eudyptula minor albosignata</i> Finsch, 1874	white-flipped blue penguin / kororā	<i>Eudyptula minor minor</i> J.R. Forster, 1781	New Zealand little penguin	Geographical variation in Checklist Committee: Two subspecies are currently recognised by the Checklist of the Birds of New Zealand (Checklist Committee): 1) Australian populations (<i>E. m. novaehollandiae</i>) and some Otago birds (<i>E. m. minor</i>). The second clade includes birds previously assigned to <i>E. m. iredalei</i> (northern Aotearoa New Zealand), <i>E. m. variabilis</i> (Te Moana-o-Raukawa / Cook Strait), <i>E. m. albosignata</i> (the white-flipped penguin of North Canterbury), <i>E. m. chathamensis</i> (Chatham Islands / Rēkohu / Wharekauri), and some <i>E. m. minor</i> (southern Aotearoa New Zealand).

Name and Authority in this Report	Common Name in this Report	Name and Authority in Committee Checklist	Common Name in Committee Checklist	Notes
<i>Falco novaeseelandiae novaeseelandiae</i> (Gmelin 1788)	eastern falcon / kārearea	<i>Falco novaeseelandiae</i> (Gmelin 1788)	New Zealand falcon	Geographical variation in Checklist Committee: A single variable species divided into three forms: bush falcon, smallest and darkest, from Te Ika-a-Māui / North Island and north-west Te Waipounamu / South Island; eastern falcon / 103kārearea103, largest and lightest, from eastern and central Te Waipounamu / South Island; southern falcon, intermediate in size and colour, from Te Rua-o-Te-Moko / Fiordland, Rakiura / Stewart Island and Auckland Island / Mauka Huka. Notes: Trewick & Olley (2016) proposed recognising subspecies on both Te Ika-a-Māui / North Island and Te Waipounamu / South Island based primarily on a size difference between islands. However, this conclusion was not supported by genetic study, and did not adequately test the proposal of Fox (1988) to recognise three forms, one of which occurs on both Te Ika-a-Māui / North Island and Te Waipounamu / South Island (Marchant & Higgins 1993). Therefore, the Checklist Committee continued to recognise no subspecies pending a more comprehensive study.
<i>Gallinula hodgenorum</i> (Scarlett, 1955)	Hodgens' waterhen	<i>Tribonyx hodgenorum</i> (Scarlett, 1955)	Hodgens' waterhen	Geographical variation in Committee Checklist: Nil.
<i>Larus bulleri</i> Hutton, 1871	black-billed gull / tarāpuka	<i>Chroicocephalus bulleri</i> (Hutton, 1871)	black-billed gull	Geographical variation in Committee Checklist: Nil.
<i>Larus dominicanus dominicanus</i> Lichtenstein, 1823	southern black-backed gull / karoro	<i>Larus dominicanus</i> Lichtenstein, 1823	southern black-backed gull	Geographical variation in Committee Checklist: Five subspecies recognised; Aotearoa New Zealand birds are of the subspecies <i>dominicanus</i> .

<i>Larus novaehollandiae scopulinus</i> J. R. Forster, 1843	red-billed gull / tarāpunga	<i>Chroicocephalus novaehollandiae scopulinus</i> (J.R. Forster, 1843)	red-billed gull	Geographical variation in Checklist Committee: Genetic research revealed five populations; Aotearoa New Zealand birds are <i>C. n. scopulinus</i>).
<i>Limosa haemastica</i> (Linnaeus, 1758)	American black-tailed (Hudsonian) godwit	<i>Limosa haemastica</i> (Linnaeus, 1758)	Hudsonian godwit	Geographical variation in Committee Checklist: Nil.
<i>Megadyptes antipodes</i> (Hombron & Jacquinot, 1841)	yellow-eyed penguin / hoiho	<i>Megadyptes antipodes antipodes</i> (Hombron & Jacquinot, 1841)	yellow-eyed penguin	Geographical variation in Committee Checklist: Three subspecies, with two extinct. The nominate subspecies is the extant yellow-eyed penguin / hoiho (<i>M. a. antipodes</i>) of the eastern Te Waipounamu / South Island, Rakiura / Stewart Island, Auckland Island / Mauka Huka, and Campbell Island / Motu Ihupuku.
<i>Meleagris gallopavo</i> Linnaeus, 1758	wild turkey / korukoru	<i>Meleagris gallopavo gallopavo</i> Linnaeus, 1758	Gould's wild turkey	Notes: A large, well-known domesticated farm bird. Feral turkey populations are widely established in rough farmland throughout Aotearoa New Zealand; scattered eastern locations in the Te Waipounamu / South Island.
<i>Mergus australis</i> Hombron & Jacquinot, 1841	Auckland Island merganser	<i>Mergus australis</i> Hombron & Jacquinot, 1841	Auckland Island merganser / miuweka*	Geographical variation in Committee Checklist: none described. Notes: The specific identity of Te Ika-a-Māui / North Island, Te Waipounamu / South Island, and Rakiura / Stewart Island <i>Mergus</i> bones is unresolved.
<i>Passer domesticus</i> (Linnaeus, 1758)	house sparrow / tiu	<i>Passer domesticus domesticus</i> (Linnaeus, 1758)	house sparrow	Aotearoa New Zealand birds are assigned to the nominate subspecies <i>domesticus</i> .

<i>Phalacrocorax melanoleucos brevirostris</i> Gould, 1837	little shag / kawaupaka	<i>Microcarbo melanoleucos brevirostris</i> (Gould, 1837)	little shag	Geographical variation in Committee Checklist: Three subspecies are globally recognised. Aotearoa New Zealand birds are of the subspecies <i>brevirostris</i> whose different plumage forms freely interbreed.
<i>Pelecanoides whenuahouensis</i> Fischer et al., 2018	Whenua Hou diving petrel / kuaka Whenua Hou	<i>Pelecanoides georgicus whenuahouensis</i> Fischer, Debski, Miskelly, Bost, Fromant, Tennyson, Tessler, Cole, Hiscock, Taylor & Wittmer 2018	Whenua Hou diving petrel	Geographical variation in Committee Checklist: Two subspecies: <i>P. g. whenuahouensis</i> breeding only on Whenua Hou / Codfish Island, and the more widespread nominate subspecies.
<i>Porzana tabuensis tabuensis</i> Gmelin, 1789	spotless crane / pūweto	<i>Zapornia tabuensis tabuensis</i> (Gmelin, 1789)	spotless crane	Geographical variation in Committee Checklist: Aotearoa New Zealand populations are included in the nominate subspecies <i>tabuensis</i> , ranging from the Philippines to south-west Polynesia, including Australia and Aotearoa New Zealand. Two other subspecies have been named from the highlands of New Guinea.
<i>Pterodroma cookii</i> (G.R. Gray, 1843)	northern Cook's petrel / tītī	<i>Pterodroma cookii cookii</i> (G.R. Gray, 1843)	northern Cook's petrel	Geographical variation in Committee Checklist: Two subspecies in Aotearoa New Zealand: northern Cook's petrel / tītī (<i>Pt. c. cookii</i>) breeding on Hauturu / Little Barrier, with a few pairs on Aotea / Great Barrier, and southern Cook's petrel (<i>Pt. c. orientalis</i>) breeding on Whenua Hou / Codfish Island.
<i>Puffinus bulleri</i> Salvin, 1888	Buller's shearwater / rako	<i>Ardenna bulleri</i> (Salvin, 1888)	Buller's shearwater	Geographical variation in Committee Checklist: Nil.
<i>Puffinus carneipes</i> Gould, 1844	flesh-footed shearwater / toanui	<i>Ardenna carneipes</i> (Gould, 1844)	flesh-footed shearwater	Geographical variation in Committee Checklist: Nil.
<i>Puffinus gravis</i> O'Reilly, 1818	great shearwater	<i>Ardenna gravis</i> (O'Reilly, 1818)	great shearwater	Geographical variation in Committee Checklist: Nil.

<i>Puffinus griseus</i> (Gmelin, 1789)	sooty shearwater / tītī	<i>Ardenna grisea</i> (Gmelin, 1789)	sooty shearwater	Geographical variation in Checklist Committee: Nil.
<i>Puffinus tenuirostris</i> Temminck, 1836	short-tailed shearwater	<i>Ardenna tenuirostris</i> (Temminck, 1836)	short-tailed shearwater	Geographical variation in Checklist Committee: Nil.
<i>Pygoscelis papua</i> J.R. Forster, 1781	gentoo penguin	<i>Pygoscelis papua taeniata</i> (Peale, 1848)	eastern gentoo penguin	Geographical variation in Checklist Committee: Two subspecies: northern gentoo penguin <i>P. p. papua</i> breeds on subantarctic islands, and the smaller southern gentoo penguin <i>P. p. ellsworthii</i> on the Antarctic Peninsula and adjacent islands.
<i>Sceloglaux albifacies albifacies</i> G.R. Gray, 1844	South Island laughing owl / whēkau*	<i>Ninox albifacies albifacies</i> (G.R. Gray, 1844)	South Island laughing owl	Geographical variation in Checklist Committee: Te Ika-a-Māui / North Island and Te Waipounamu / South Island specimens are sometimes treated as different subspecies on the basis of size and minor plumage differences.
<i>Sterna striata striata</i> Gmelin, 1789	white-fronted tern / tara	<i>Sterna striata</i> (Gmelin, 1789)	white-fronted tern	Geographical variation in Checklist Committee: Nil.
<i>Sterna hirundo longipennis</i> Nordmann, 1835	eastern common tern	<i>Sterna hirundo</i> , Linnaeus 1835	common tern	Geographical variation in Checklist Committee: Three subspecies are recognised but only the eastern tern <i>S. h. longipennis</i> has been recorded from Aotearoa New Zealand.
<i>Stictocarbo punctatus</i> (Sparrman, 1786)	spotted shag / kawau tikitiki	<i>Phalacrocorax punctatus</i> (Sparrman, 1786)	spotted shag	Geographical variation in Checklist Committee: No subspecies recognised.
<i>Sturnus vulgaris</i> Linnaeus, 1758	common starling / tāringi	<i>Sturnus vulgaris vulgaris</i> Linnaeus, 1758	common starling	Geographical variation in Checklist Committee: Aotearoa New Zealand birds are assigned to the subspecies <i>vulgaris</i> .
<i>Thalassarche melanophris</i> (Temminck, 1828)	black-browed mollymawk / toroa	<i>Thalassarche melanophris</i> (Temminck, 1828)	black-browed albatross	Geographical variation in Checklist Committee: Nil. Sometimes considered conspecific with Campbell black-browed mollymawk.

<i>Turdus merula</i> Linnaeus, 1758	Eurasian blackbird / manu pango	<i>Turdus merula merula</i> Linnaeus, 1758	Eurasian blackbird	Geographical variation in Checklist Committee: Aotearoa New Zealand birds are assigned to the nominate subspecies <i>T. m. macula</i> .
<i>Xenicus gilviventris rineyi</i> Falla, 1953	southern rock wren / pīwauwau	<i>Xenicus gilviventris</i> Von Pelzeln, 1867	rock wren	Geographical variation in Checklist Committee: The subspecies <i>rineyi</i> was proposed for birds found in Te Rua-o-Te-Moko / Fiordland, but is not currently recognised. Variation in rock wren throughout their range is under investigation.

Regional conservation status of birds in Otago

Appendix 5: Specified Highly Mobile Fauna listed in the National Policy Statement for Indigenous Biodiversity (NPS-IB, 2023) found in the Otago Region (bird taxa only)

Name and Authority in this Report	Common Name in this Report	Regional Conservation Status	Ecosystem from NPS-IB
<i>Anarhynchus frontalis</i> Quoy & Gaimard, 1830	wrybill / ngutu pare	Regionally Critical	coastal/riverine
<i>Anas superciliosa</i> Gmelin, 1789	grey duck / pāpera	Regionally Data Deficient	wetland/riverine
<i>Anthus novaeseelandiae novaeseelandiae</i> Gmelin, 1789	New Zealand pipit / pīhoihoi	Regionally Not Threatened (Otago)	forest/open
<i>Ardea modesta</i> J.E. Gray, 1831	white heron / kōtuku	Regionally Migrant	wetland/riverine
<i>Botaurus poiciloptilus</i> (Wagler, 1827)	Australasian bittern / matuku-hūrepo	Regionally Critical	wetland/riverine
<i>Bowdleria punctata punctata</i> Quoy & Gaimard, 1830	South Island fernbird / mātātā	Regionally Declining	wetland/riverine
<i>Calidris canutus rogersi</i> Mathews, 1913	lesser knot / huahou*	Regionally Vagrant	coastal/riverine
<i>Charadrius bicinctus bicinctus</i> Jardine and Selby, 1827	banded dotterel / pohowera	Regionally Vulnerable	coastal/riverine
<i>Charadrius obscurus obscurus</i> Gmelin, 1789	southern New Zealand dotterel / tūturiwhatu	Regionally Vagrant	coastal/riverine
<i>Chlidonias albobristatus</i> (G.R. Gray, 1845)	black-fronted tern / tarapirohe	Regionally Endangered	coastal/riverine
<i>Egretta sacra sacra</i> Gmelin, 1789	reef heron / matuku moana	Regionally Vagrant	coastal/riverine
<i>Falco novaeseelandiae novaeseelandiae</i> (Gmelin 1788)	eastern falcon / kārearea	Regionally Vulnerable	forest/open
<i>Gallirallus philippensis assimilis</i> (G.R.Gray, 1843)	banded rail / moho pererū	Regionally Extinct	wetland/riverine
<i>Haematopus finschi</i> Martens, 1897	South Island pied oystercatcher / tōrea	Regionally Vulnerable	coastal/riverine
<i>Haematopus unicolor</i> J.R. Forster, 1844	variable oystercatcher / tōrea pango	Regionally Vulnerable	coastal/riverine
<i>Himantopus novaezelandiae</i> Gould, 1841	black stilt / kakī	Regionally Vagrant	wetland/riverine
<i>Hydroprogne caspia</i> (Pallas, 1770)	Caspian tern / taranui	Regionally Migrant	coastal/riverine
<i>Hymenolaimus malacorhynchos</i> (Gmelin, 1789)	whio / kōwhiowhio	Regionally Critical	riverine
<i>Larus bulleri</i> Hutton, 1871	black-billed gull / tarāpuka	Regionally Vulnerable	coastal/riverine
